

Morbidity and Mortality

Weekly Report

U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE
PUBLIC HEALTH SERVICE

Prepared by the COMMUNICABLE DISEASE CENTER MEIrose 4-5131

For release November 2, 1962

ATLANTA 22, GEORGIA

Vol. 11, No. 43

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED OCTOBER 27, 1962

POLIOMYELITIS - A total of 21 cases of poliomyelitis (19 paralytic) was reported for the week which ended October 27. These totals mark the lowest noted for this month and are remarkably below the 56 cases (41 paralytic) reported during the comparable week in 1961.

Only eleven States reported cases this week with the West South Central States of Arkansas, Louisiana, Oklahoma and Texas accounting for 9 of the 21 cases reported. Illinois reported 4 of the remaining cases.

During recent weeks, an outbreak has become manifest in Fayetteville, Arkansas. Four cases, one fatal, have been officially reported; at least three additional suspect cases are under investigation. The cases are scattered geographically in the area, most are children. Laboratory studies are in progress. A community-wide

immunization program employing oral vaccine is being planned.

The cumulative totals for poliomyelitis incidence through the 43rd week in 1962 and for a comparable period during the past four years are shown in the following table:

Poliomyelitis (1st through 43rd Week) 1958-1962

	1962	1961	1960	1959	1958
Paralytic	568	741	1,932	4,908	2,460
Total	716	1,142	2,798	7,491	4,998

As depicted in the accompanying graphs, both total reported poliomyelitis cases and the number of paralytic cases, since August, have remained substantially below that of recent years.

Table 1. CASES OF SPECIFIED NOTIFIABLE DISEASES: UNITED STATES
(Cumulative totals include revised and delayed reports through previous week)

CURRENT U.S. POLIO INCIDENCE
 COMPARED WITH YEARS 1957, 1959 and 1961
 April-December, by week

DATA PROVIDED BY NATIONAL OFFICE OF VITAL STATISTICS AND COMMUNICABLE DISEASE CENTER

INFLUENZA – No reports have been received to date regarding possible influenza outbreaks during the present fall season. During the last major epidemic of A₂ influenza in 1959-60, the earliest epidemics were recorded in late December in Texas, Ohio and Hawaii. In the 1961-62 influenza B outbreak, outbreaks were first noted in Florida, California, Arizona and Saskatchewan during mid-November.

EPIDEMIOLOGICAL REPORTS

Staphylococcal Food Poisoning – Georgia

At least 13 of 90 persons who ate lunch in a small supermarket restaurant became abruptly ill with nausea, vomiting and diarrhea within 1-1/4 to 4-1/4 hours (median 3-1/4 hours) after eating. Three of these persons required hospitalization, one of whom experienced a marked drop in blood pressure.

Food consumption histories obtained from 11 of those ill and 11 who had not become ill incriminated chicken and dressing. The chicken had been cooked, boned and refrigerated the previous afternoon by the restaurant manager. The bones were placed in a box and set aside for the neighbor's dog. The boned meat was warmed between 9:00 A.M. the following morning for service at 11:00 A.M. The dressing was freshly prepared and was served hot.

The only food samples available were meat scraps from the bones. Culture of this material revealed enormous

numbers of *Staphylococcus aureus*, phage type 6/7/47/53 54/75/83A. This same phage type was isolated from the stool specimen of a patient and from the anterior nares of the restaurant manager's husband who occasionally worked in the restaurant. From the restaurant manager herself, a non-reactive strain of *S. aureus* was obtained.

(Reported by Dr. J. E. McCroan, Assistant Director, and T. W. McKinley, Research Technician, Georgia Department of Public Health.)

Salmonella newport food poisoning – Louisiana

Between 10 and 36 hours following a church picnic, all of the 32 who attended the picnic became ill with cramps, headache, diarrhea and vomiting. The menu had included new potatoes with sauce, peas, green salad, cake and barbecued ham. At least some of the ham had been eaten by all at the picnic.

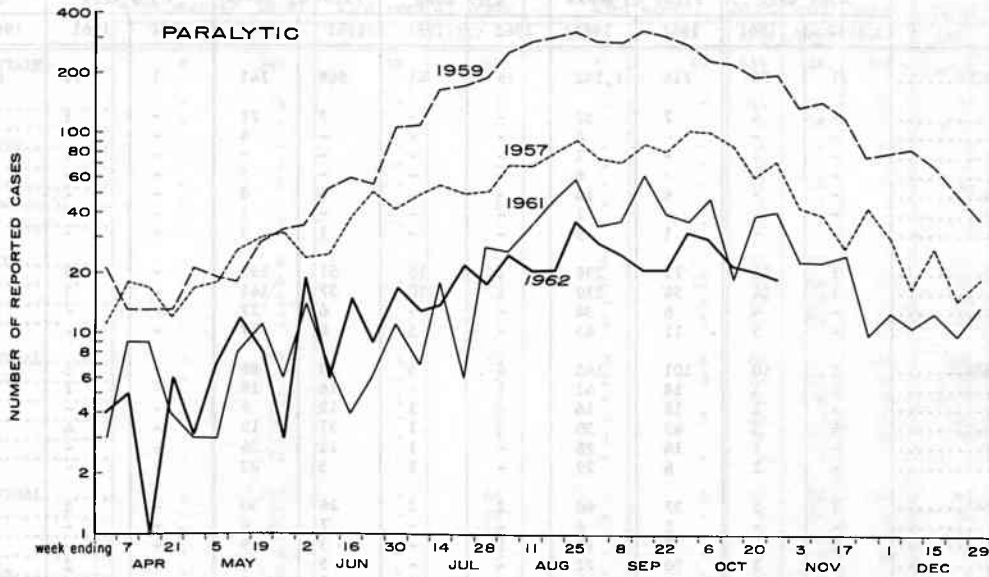

The ham was barbecued at a commercial establishment, sliced on the day of the picnic and delivered to the church approximately two hours before the picnic along with containers of barbecue sauce.

From stool specimens obtained from the 32 who became ill, *Salmonella newport* was recovered from 27. Twelve were still positive three weeks following the picnic. Of the employees at the barbecue, two were found to be carrying salmonellae in their stools but neither of the strains obtained was *S. newport*. Slices of the barbecued ham revealed *S. newport*.

(Reported by Dr. Pattie Van Hook, Acting Director, Caddo-Shreveport Health Unit, Shreveport, Louisiana.)
