Morbidity and Mortality

Weekly Report

U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE PUBLIC HEALTH SERVICE

Prepared by the

COMMUNICABLE DISEASE CENTER

634-5131

For release February 1, 1963

ATLANTA 22, GEORGIA

Vol. 12. No. 4

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED JANUARY 26, 1963

INFLUENZA - Respiratory disease outbreaks are currently in progress in several areas of Maryland, Virginia, and North Carolina. Isolates of the Asian Influenza virus or serologic titer rises to Asian Influenza virus have been reported from outbreaks in each of these States. In addition, a confirmed Asian Influenza outbreak has been reported from a convalescent home in Kansas. These are the only four States of the country which have reported outbreaks of Asian Influenza during the current influenza season.

The weekly deaths from pneumonia and influenza have exceeded the epidemic threshold for the third successive week. The excess reflects an excess mortality in sample cities from the Northern States, West South

Central States, and South Atlantic States (currently the focus of recognized influenza activity).

Reports of the influenza outbreaks in the affected areas follow.

EPIDEMIOLOGICAL REPORTS

Influenza-like Illness Follow-up - Baltimore

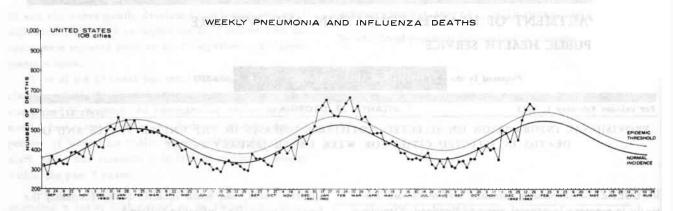

School and industrial absenteeism in the Baltimore area continues high and there is as yet no conclusive evidence of decline. In addition, a sudden outbreak of febrile illness clinically compatible with influenza has occurred at the Maryland State House of Correction in Jessup. Since January 23rd approximately 350 inmates in a total population of 1800 have been affected.

THE POST OF THE PARTY OF THE PA	Call 10 minuted	CCm.aUNGAELERUSA	SE GERTI

In order to more fully assess school absenteeism, an elementary and junior high school in central Baltimore was chosen for more intensive study. The school has a total enrollment of 1400 in the age groups 6 through 15. Increased absenteeism began about January 14th reaching a rate of 30 percent on January 25th.

On January 26th a sample of 89 children absent on January 25th were surveyed by telephone. Of the 89, 14 (16%) were absent for reasons unrelated to illness. Sixty-five children (73%) were absent because of illness clinically compatible with influenza. The symptomatology elicited for 35 absent children between the ages of 12 15 is given below.

Symptomatology	Number	Percent
Malaise	34	97
Cough	33	94
Fever	32	92
Headache	26	74
Myalgia	23	66
Sore throat	22	63
Coryza	20	57
GI complaint	13	37

The symptomatology is similar to that reported from the outbreak in Pembroke, North Carolina, in MMWR, Vol. 12. No. 2.

(Reported by Dr. John H. Janney, Acting Chief, Division of Epidemiology, Maryland Department of Health, and Dr. Matthew Tayback, Assistant Commissioner of Health, Baltimore City Health Department.)

Influenza-like Illness - Virginia

A sharp increase in total influenza-like cases reported to State health officials was noted for the week ending January 26. Approximately 1,000 cases were reported by physicians throughout the State as compared with recent weekly totals averaging 60-70. Cases were scattered over most of the 33 counties reporting, with the greatest concentration occurring in the Richmond area. Physicians working with the Home Service Program of a large medical center in Richmond have noted a recent increase in influenza-like illness among their patients. Paired sera have demonstrated a significant titer

rise to type A_2 influenza from one case in this group. School absenteeism in Goochland County, a suburban area adjoining Richmond, has risen from usual levels of about 5% to 18.5% during the past week, largely due to influenza-like illness. Neighboring communities in Henrico and Caroline Counties have also accounted for a large percentage of the total cases reported. Local and State health officials are presently attempting to obtain further laboratory confirmation for this outbreak.

(Reported by James B. Kenley, M.D., Director, Bureau of Epidemiology, Virginia State Department of Health.)

Influenza - North Carolina - Follow-up Report

During the past week, new cases of influenza-like illness continued to be reported from communities in and around Robeson County, scene of a recent influenza outbreak (MMWR Vol. 12, Nos. 2 and 3). In addition, new epidemic foci have been observed in three northern counties near the Virginia border, as well as in Wake County in the central part of the State.

The first evidence of a significant outbreak occurring outside the Robeson County area came from the town of Enfield in Halifax County, about 35 miles from the Virginia State line. School absenteeism reached peak levels of 40% during the period January 17-21, most absence being attributed to illness clinically consistent with influenza. At about the same time, local health officials in adjoining Nash and Edgecombe Counties noted a definite increase in influenza case reports coming from physicians in these areas.

A sudden increase in absenteeism, reaching peak levels of 40%, during the period January 25-28, was also observed in schools serving the town of Fuquay Springs in Wake County, about 20 miles south of Raleigh. Absenteeism was attributed to a "flu-like" illness. Throat washings and acute sera have been obtained by local health officials in each of these areas.

The epidemic continued to decline at its point of origin in Robeson County. New cases continue to be seen in neighboring Hoke and Cumberland Counties, most

of these apparently representing limited outbreaks confined largely to areas close to the Robeson County line.

Additional laboratory data obtained this week has further confirmed type A2 (Asian) influenza as the etiologic agent in the Robeson County outbreak. Of 9 sets of paired sera submitted to the Respirovirus Laboratory, CDC, 8 showed greater than fourfold titer rises to the Asian antigen, when tested for H.I. (hemagglutination inhibition) antibody. The remaining pair demonstrated a significant titer rise to parainfluenza virus, type 1. Parainfluenza virus type 1 was also recovered from throat washings obtained from this patient. Thus far, A2 influenza virus has been recovered from one case in the epidemic. Hemagglutinating agents have been found in throat washings obtained from 4 other cases. These are presumed to represent influenza A2 on the basis of the serologic evidence now: available, although definite characterization of these isolates must await serial passage of the virus.

No outbreaks have been reported in the neighboring

States of South Carolina, Tennessee, and Georgia.
(Reported by Jacob Koomen, M.D., Asst. State Health Director, North Carolina.)

Influenza - Kansas

A convalescent home in Johnson County, Kansas, experienced an outbreak of febrile respiratory disease which began on January 18. Eleven of 64 elderly residents, most of whom have chronic debilitating disease, developed illnesses characterized by acute onset of fever, malaise, headache, myalgia, and cough. Hemagglutinating agents have been recovered in monkey kidney tissue in three of eight individuals from whom throat washings were obtained. One of these agents has been typed as Asian influenza by both hemagglutination inhibition and hemadsorption inhibition tests. One of the cases from whom an agent was not isolated expired on January 26.

(Reported by Dr. Don E. Wilcox, State Epidemiologist, Kansas State Board of Health, and the Kansas City Field Station of CDC.)

(Continued on page 32)

SUMMARY OF DEATHS AMONG PERSONS 65 YEARS AND OVER IN 108 U. S. CITIES

The weekly average number of deaths among persons 65 years and over in 108 cities for the four-week period ending January 26 was 7,311 as compared with an expected 6,900 weekly average.

		WEEK E		4 Week	Weekly
