COMMUNICABLE DISEASE CENTER

634-5131

For release March 22, 1963

ATLANTA 22, GEORGIA

Vol. 12, No. 11

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED MARCH 16, 1963

INFLUENZA — One or more outbreaks of influenza-like disease have now been reported from 37 States and the District of Columbia. States reporting outbreaks for the first time this week are New Hampshire, Idaho, and Alaska. Influenza A2 virus has been isolated or confirmed by serologic titer rise as the causative agent of one or more outbreaks in 25 States and the District of Columbia. States reporting confirmed outbreaks for the first time this week are Vermont, Rhode Island, Arkansas, and Tennessee. With the exception of localized outbreaks in Idaho, Montana, and Alaska and the more widespread community outbreaks in Arizona reported in last week's MMWR (Vol.

12, No. 10), the Mountain and West Coast States continue to report no more than the usual seasonal incidence of acute respiratory disease. The number of pneumonia-influenza deaths reported weekly for 108 cities has remained above the epidemic threshold since the week ending January 12, and this week demonstrates a continued rise.

The following reports are from areas of the country currently experiencing new or widening outbreaks of influenza-like disease:

Alaska - An increased incidence of acute respiratory disease has been noted in the city of Juneau, begin-

ning about the first of March. There has been some increase in industrial absenteeism in the area but little increase in school absenteeism.

Georgia.

58

(Reported by E. O. Wicks, M.D., Division of Public Health, Alaska Department of Health and Welfare).

Arkonsos - A laboratory confirmed outbreak of type A₂ influenza has been reported from Jefferson County in the central part of the State. The outbreak has thus far been confined to a single small community (pop. 980) where cases have occurred largely among adults. Earliest cases were observed in mid-February; the epidemic is now past its peak. Serologic confirmation has been obtained in two cases thus far.

(Reported by J. T. Herron, M.D., William L. Bunch, Jr., M.D., Arkansas State Health Department).

Arizona - Follow-up - As part of epidemiologic studies undertaken during the outbreak of influenza on the Hopi Indian Reservation (MMWR Vol. 12, No. 9), surveys of two villages in the area of Second Mesa were done in order to determine attack rates for influenza-like disease.

Both villages experienced substantial outbreaks, which had subsided just prior to the survey. The overall attack rate for 317 people surveyed (the total population of both villages) was 31 percent. Age specific attack rates are given in the table below:

AGE GROUP	POPULATION	CASES	ATTACK RATE %
0 - 4	65	22	34
5 - 14	84	27	29
15 - 24	32	9	28
25 - 34	32	9	28
35 - 49	22	9	41
50 - 64	27	11	41
65 +	23	6	26
Unknown	22	5	23
Totals	317	98	31

(Reported by Dr. W. S. Baum, Area Medical Office, Division of Indian Health, Phoenix, Arizona, and the Communicable Disease Center).

Idoho - A limited outbreak of influenza-like illness, thus far confined to a single small community, has been reported from Latah County in the northwestern part of the State. The outbreak was first noted in late February and is now past its peak. The illness was clinically compatible with influenza, although laboratory confirmation is not available. School-age children appeared to be involved most, several schools in the community having been closed at the height of the epidemic.

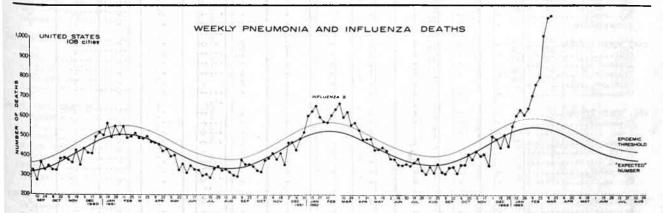

(Reported by Dr. John A. Mather, Chief, Preventive Medicine, Idaho Department of Health).

New Hampshire - Seven counties in southern New Hampshire reported outbreaks of influenza-like illness during the week ending March 16. Four of these counties lie adjacent to sites of recent outbreaks in the neigh-

boring States of Maine and Vermont. It is estimated that the epidemic began in early March and probably reached its peak last week. Cases have been relatively mild clinically, causing moderate increases in school absenteeism in several areas. Laboratory confirmation is not yet available.

(Reported by Dr. William Prince, Bureau of Communicable Disease, New Hampshire State Health Department).

Ohio - Twenty-eight of Ohio's 88 counties have reported outbreaks of influenza-like illness since January 1. Hamilton, Franklin, Highland and Scioto Counties have each had two or more laboratory confirmed cases (by virus isolation or rise in titer). Nineteen of the 28 counties reporting acute febrile respiratory disease are in the south
(Continued on page 92)

Pneumonia-influenza deaths — During the week ending March 16th, 585 excess pneumonia-influenza deaths were reported. This is the largest excess number recorded in any week since the first appearance (1957) of influenza A2 in this country. During 1957-58 the greatest number of excess deaths was 542 during the week ending November 9, 1957. In the 1960 influenza A2 epidemic, 508 excess deaths were reported during each of the weeks ending February 13th and 20th.

The cumulative total of pneumonia-influenza deaths reported since the week ending January 5, 1963, is 2,640. In 1960, the corresponding number was 3,813. However, during the current epidemic, excess deaths began to increase later in the season than in 1960 and are still at high levels.

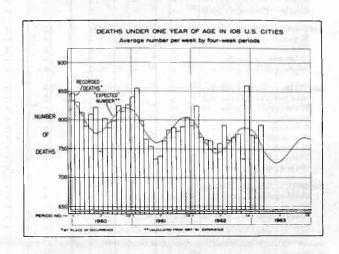

During the current week, increases occurred in the South Central, West North Central and Mountain States. The New England and East North Central States remained at approximately last week's levels. Decreases were reported by the Middle and South Atlantic States. No excess mortality has thus far been observed in the Pacific States.

Excess deaths from all causes during the week ending March 16th were 1,977. Although the weekly excess for all causes has now decreased for two weeks, the cumulative total of 14,334 deaths now exceeds the comparable total for 1960.

As shown in the accompanying table and chart an excess of 136 infant deaths was reported during the four-week period ending March 16th. The excess was concentrated in the weeks ending March 2nd and 9th.

Estimate - based on average percent of divisional total. Totals for previous weeks include reported corrections.

NOTE: All deaths by place of occurrence.

⁴⁽D) Total Deaths, Persons 65 years and over.... 8,278

ern half of the State. Increased pneumonia-influenza mortality was reported from the cities of Canton, Cincinnati, Cleveland, and Toledo during February and early March. Outbreaks now appear to be waning for the State as a whole.

(Reported by Dr. Winslow Bashe, Division of Communicable Diseases, Ohio Department of Health.)

Pennsylvania - Four counties, representing widely separated regions of the State, reported new outbreaks of influenza-like illness during the week ending March 9. School absentee rates as high as 30 percent have been observed in some affected areas. Influenza-pneumonia deaths for Allegheny County totaled 32 for the week ending March 9, this being the highest number recorded for any week during the past six years. This figure is far out of proportion to other indices of epidemic activity in the county, however.

Philadelphia County has reported serologic confirmation of influenza A2 infection in 20 cases thus far. None of these cases came from community-wide outbreaks, however.

(Reported by W. D. Schrack, Jr., M.D., Division of Communicable Disease Control, Pennsylvania Department of Health).

Rhode Island - Type A2 influenza has been confirmed serologically in two or more cases from Newport and Providence Counties, the sites of reported outbreaks earlier this year. No new epidemic foci have been observed in the State during the past week.

(Reported by Dr. James E. Bowes, Division of Epidemiology, Rhode Island Department of Health.)

Vermont - Laboratory confirmation has been obtained in two cases seen during recent outbreaks in Essex County. Twelve of the State's 14 counties have reported one or more outbreaks of influenza-like illness thus far this year.

(Reported by Dr. Linus J. Leavens, Director, Communicable Disease Control, Vermont Department of Health.)

INTERNATIONAL NOTES - QUARANTINE MEASURES

Typhoid - Zermatt, Switzerland

Over 80 cases of typhoid fever have been reported from several countries, including the United States, which are believed to derive from a common-source exposure in the winter resort town of Zermatt, Switzerland. The exposure is reported to have occurred in mid to late February; the nature of spread, whether by food or water, is yet unknown. A number of strains isolated have been phage type E-1. (This type is common in the United States, accounting for about one third of the cases.)
