POLIOMYELITIS SURVEILLANCE REPORT
NO. 116 THIRD YEAR JULY 5, 1957
U.S. Department of Health, Education and Welfare Public Health Service Bureau of State Services

Communicable Disease Center
Poliomyelitis Surveillance Unit
50 Seventh Street, N.E.
Atlanta, Georgia

SPECIAL NOTE
The information in this report represents a factual summary of preliminary data reported to the Poliomyelitis Surveillance Unit from State Health Departments, Epidemic Intelligence Service Officers, participating laboratories and other pertinent sources. It is understood that the contents of these reports will not be released to the press, except by the Office of the Surgeon General, Public Health Service, U. S. Department of Health, Education and Welfare. State Health Officers, of course, are free to release any information they may wish concerning data from their state.

I. Current Poliomyelitis Morbidity Trends
II. Routine Poliomyelitis Surveillance
III. Vaccine Distribution

## I. Current Poliomyelitis Morbidity Trends

Total national poliomyelitis incidence has remained stable. A total of 142 cases was reported to the National Office of Vital Statistics for the week ending June 29, compared to 134 cases reported for the week of June 22. Figure 1 presents the national incidence by weeks for April to July of the years 1952 through 1957.

Incidence by states and regions for the past six weeks is presented in Table l, with six-week totals for the comparable period of the past four years. A slight increase in incidence was reported in the North East, South East and South Central Regions. Of particular note were increases in Louisiana and Tennessee.

Dr. C. B. Tucker, State Epidemiologist, Tennessee State Department of Public Health, has reported that 12 of the 16 cases in the state are in Johnson City, a tow of 28,000 persons. All of these cases are nonparalytic, suggesting the possibility that this may be a non-poliovirus infection. Dr. Lauri Thrupp is accompanying Dr. Tucker in a field investigation of this outbreak.
II. Routine Poliomyelitis Surveillance

During the week June 26 through July 3, the Polio Surveillance Unit received reports of three poliomyelitis cases occurring within 30 days of a polio vaccine inoculation in 1957. Of these three cases, one was paralytic and two nonparalytic.

The paralytic case, Texas-154, developed symptoms 29 days after an inoculation in the arm with Lilly vaccine, an unknown lot number. Paralysis was in the right leg.

Iowa reported a triply-vaccinated nonparalytic case inoculated with Lilly vaccine lot number 676305, one million cc's distributed during May and June, 1956. PSU has received reports of five other nonparalytic and three uncorrelated paralytic cases in association with this lot. Texas reported one nonparalytic case with onset of symptoms five days following inoculation, vaccine manufacturer and lot number unknown.
III. Vaccine Distribution

Table 2 presents a summary of current and cumulative shipments of vaccine (in 1000's of cc's of net bottled vaccine). Excluding export, 3.5 million cc's were shipped during the first three weeks of June.

The Vaccine Inventory on June 21, 1957, totaled 8.5 million cc's including vaccine unshipped by manufacturers and vaccine on hand in State and Local Health Departments, Physicians' Offices and in Commercial Channels.
(This report was prepared by Dr. A. D. Langmuir and Miss Helen Forester with assistance from the Statistics Section, CDC)
