Abstract

Optimization and experience with using EHRs may improve physician experiences. Physician opinions about EHR-related impacts, and the extent to which these impacts differ by self-reported optimized EHR use and length of experience are examined through nationally representative physician data of EHR users from the National Electronic Health Records Survey extended survey (n=1,471). Logistic regression models first estimated how physicians' length of times using an EHR were associated with each EHR-related impact. Additionally, a similar set of models estimated the association of self-reported optimized EHR use with each EHR impact. At least 70% of physicians using EHRs continue to attribute their administrative burdens to their EHR use. Physicians with 4 or more years of EHR experience accounted for 58% of those using EHRs. About 71% of EHR users self-reported using an optimized EHR. Physicians with more EHR experience and those in practices that optimized EHR use had positive opinions about the impacts of using EHRs, compared to their counterparts. These findings suggest that longer experience with EHRs improves perceptions about EHR use; and that perceived EHR use optimization is crucial to identifying EHR-related benefits. Finding ways to reduce EHR-related administrative burden has yet to be addressed.

Introduction

The benefits promised by health information technology (IT) are numerous: safer and better coordinated care, and improved quality, population health, and administrative efficiencies [1]. Despite nearly all physicians using electronic health records (EHRs), not all user

experiences are positive: increased administrative burdens, "click fatigue," and interference with patient interactions have been described [2–6].

Practices may benefit from optimization: Clinical, financial, and operational assessments provide process refinements, workflow redesign, or practice-specific modifications for practices to effectively use their EHR [4,7,8]. Smaller qualitative studies have found that optimizing EHR use may improve physician experiences [7–9]. Installation and placement of workstations, coordination of work across a team, trainings, and identifying appropriate clinical decision support needs are considerations for any health IT implementation and optimization [3]. Providers may also identify new, previously difficult processes, such as running reports for managing patient populations by either demographics or chronic conditions. Use of health IT evolves as healthcare providers become more comfortable with the technology.

This study examines positive and negative opinions about EHR-related impacts on administrative burden, financial benefits, patient care, and data security. Opinions about the effects of EHR use were also examined by the length of time the physician used an EHR system and by whether the practice had optimized its EHR use.

Materials and Methods

The National Center for Health Statistics' National Electronic Health Records Survey (NEHRS) measures physician and office characteristics, including EHR use. In 2014, nationally representative samples of physicians were randomly selected to receive special expanded content about the physician perceived-impacts of EHR use; questionnaires are available from the NCHS website [10]. Among eligible physicians, 1,763 completed the questionnaire with an un weighted response rate of 61%. More detail on the survey is publically available [11].

Methods

Only physicians with an EHR system (n=1,471, 82% weighted) were analyzed. The length of time a physician used an EHR system was based on the question, "estimate the approximate number of years you have used any EHR system," and was defined as either at least 4 years EHR use or under 4 years EHR use to coincide with the start of the Medicare and Medicaid EHR Incentive Programs in 2011 for eligible professionals (Table 1).

Physicians were asked the degree to which they agreed or disagreed with statements about EHR-related impacts. All questions about EHR-related impacts were recorded into agree or disagree [12] Optimization was similarly defined by agreeing with the statement "overall, my practice has optimized the use of its EHR system."

A set of logistic models estimated how physicians' lengths of time using an EHR were associated with each EHR-related impact. A similar set of models estimated the association of self-reported optimized EHR use with each EHR impact. Marginal effects for each EHRrelated impact were calculated after controlling for certified EHR, delivery system reform participation, physician age, specialty, practice size, ownership, and geographic

characteristics include technical information about variables and analyses. Analyses were conducted using Stata 12.1 (College Station, TX) (Tables 2–4).

Results

Overall impacts of EHR use

Among physicians with EHRs, responses to positive EHR-related administrative impacts ranged from 44% of physicians reporting that their EHR saved time overall to 69% of physicians reporting that they received laboratory results faster due to EHRs (Figure 1). Responses to negative EHR-related administrative impacts were higher, ranging from 70% of physicians agreeing that the time spent reviewing patient information had increased to 84% agreement with increased time spent documenting care. 24% of physicians indicated EHR use produced clinical benefits (Figure 2). A majority of physicians (58%) indicated that their EHR allowed them to deliver better care however, more than 60% of physicians reported that their EHR disrupted their interactions with patients.

A majority of physicians (60%) indicated that the benefits of the EHR outweighed the cost, while just 48% indicated that their EHR produced financial benefits for the practice (Figure 3). Less than one-quarter of physicians reported incomplete billing from their EHR use.

Length of EHR experience

Physicians with 4 or more years of EHR experience accounted for 58% of the physician population using EHRs (Table 1). Physicians with 4 years or more experience were more likely to agree with positive impacts related to EHR use, across all 4 categories, than physicians with less experience (Figure 4, Table 3). The largest percentage difference in opinions associated with length of EHR experience was observed with patient care. Of the physicians with at least 4 years of EHR experience, 64.8% reported that their EHRs allowed them to provide better patient care; of those with less than 4 years of experience, 43.4% reported this– the difference being 21.4 percentage points. The smallest percentage difference among positive impacts was observed in the faster receipt of laboratory results (12 percentage point difference).

Differences in the negative impacts of EHR use were small and generally not of statistically significant with 2 exceptions. Physicians with more EHR experience had lower agreement about the disruption of patient interactions (12 fewer percentage points) and incomplete billing resulting from EHR use (8 fewer percentage points) compared to physicians with less experience.

Optimization of EHR use

About three-quarters of physicians with EHRs agreed with the statement that their practice had optimized its use of EHRs (Table 1) [10]. Physicians who self-reported optimized EHR use by their practice were more likely to report overall practice efficiency (74 vs. 28%) and that their EHR saved time (54 vs. 13%), compared to those who did not report optimized use. Relative to those physicians who did not report optimized use, physicians self-reported optimized EHR use were more likely to report that benefits of an EHR outweighed its cost

(69 vs. 31%), EHRs allowed them to deliver better patient care (69 vs. 23%), and to identify clinical and financial benefits (82 vs. 51% and 54 vs. 25%, respectively).

Smaller differences in negative EHR-related impacts were observed between physicians who believed their practices had optimized EHR use and those that did not (Figure 5). About 80% of physicians who self-reported optimized EHR use reported that the time spent documenting care had increased, compared to 91% of their counterparts (Figure 6). Between 67 and 83% of physicians across both groups reported that the time spent ordering medical services and reviewing patient information had increased as a result of their EHR system. Fewer physicians who self-reported optimized EHR use by their practice believed that their EHR disrupted physician interactions with patients compared to those who did not report optimization (58 vs. 85%).

Discussion

As seen in earlier attitudinal studies, opinions about EHR-related impacts were mixed [13,14]. Across nearly all domains, a majority of physicians reported positive EHR-related benefits, which includes better patient care, enhanced data confidentiality, and that the benefits of EHR use outweigh its costs. Physicians with longer EHR experience or with self-reported optimized EHR were more likely to report positive impacts than their counterparts. Also, a high percentage linked their EHR use with increased administrative burden and patient disruption. Although physicians with self-reported optimized EHR use had lower perceived administrative burden than their counterparts, overall, a majority still agreed with those negative EHR impacts related to time spent using their EHR to review information, order services, and document care.

Optimization requires significant financial and staffing resources to implement, is an ongoing process, and is hard to standardize. [7,8,15,16]. Although EHR optimization presents a unique challenge for every practice, it is often tailored to meet a specific practice's need. These analyses show that self-reported optimized EHR use was associated with physician agreement for the majority of positive EHR-related impacts, suggesting optimization may have implications for safety and quality.

While about three-quarters of physicians self-reported their agreement that their practice "optimized its EHR use", the definition of optimization was left to the respondent's discretion and how physicians interpreted this may be hard to elucidate. In earlier cognitive work, evaluation of other questions indicated that physicians did not typically think about official definitions when responding; rather it is likely that respondents were thinking about altering their system to suit their needs when answering the optimization question [12]. There is a need to further study the impacts on EHR use by optimization type yet there were differences in the perception of self-reported optimization on opinions of EHR use.

At least 70% of all physicians attributed EHR use with spending more time on administrative tasks. This percentage remained high even after accounting for optimized use. As physicians become more familiar with their systems or modify them to meet their specific needs, the amount of time spent on administrative tasks may diminish.

Conclusion

These findings suggest that longer experience with EHRs improves perceptions about EHR use; and that perceived EHR use optimization may identify benefits associated with health IT. Finding ways to reduce EHR-related administrative burden has yet to be addressed.

Positive Impacts

Negative Impacts

Page 9

My EHR allows me to deliver better patient care. My EHR produces financial benefits for my practice. My practice functions more efficiently with an EHR system. The benefits of having an EHR outweigh its cost. My EHR system meets my practice's clinical needs. My EHR produces clinical benefits for my practice. My EHR enhances patient data confidentialty. My EHR saves me time. My practice receives lab results faster.

The time spent documenting patient care has increased. The time spent ordering medical services has increased. The time spent reviewing patient information has increased. Health information is less secure in my EHR system. Use of my EHR results in incomplete billing for services. My EHR disrupts the way I interact with my patients.

					4 or more years
				Length of use of EHK	

Less than 4 years'

Notes:

indicates reference group in model.

Length of EHR use was measured based on the item: "Estimate the approximate number of years you have used any EHR system." The analyses compared physicians with 4 or more years of experience to excluded from the anlaysis. For each attitude, missing observations were removed resulting in different sample sizes for each question. Analyses were conducted using Stata 12.1 to account for weights and those with 3 years or less. Physicians that answered a non-integer number were rounded to the nearest whole year. Length of EHR use was missing observations for 6.9 percent of physicians, and excluded from the analysis. Optimization was measured based on the item "Indicate the extent to which you agree or disagree with the following statements about using your EHR system: Overall my practice has optimized the use of its EHR system." The analyses compared physicians who agree to those who disagree with the statement. Optimization was missing observations for 3 percent of physicians, and sample design. Interactions were not used as first we assessed EHR experience, then assessed the role of optimization for each impact. Given we saw differences in optimization, while controlling for experience, we did not further assess interaction between experience and optimization.

Dependent variables

My EHR system(s) meet(s) my practice's clinical needs The time spent ordering medical services has increased. My practice receives lab results faster. The time spent reviewing patient information has increased. My EHR produces clinical benefits for my practice. Overall, my EHR saves me time. The time spent documenting patient care has increased. Overall, my practice functions more efficiently with an EHR system. My EHR disrupts the way I interact with my patients. My EHR allows me to deliver better patient care. Health Information is less secure in my EHR system than a paper-based system. My EHR enhances patient data confidentialty. My EHR produces financial benefits for my practice. Use of my EHR results in incomplete billing for services.

Overall, the benefits of having an EHR outweigh its cost.

Note: Marginal effects are presented from logistic regression, where estimates are adjusted for having a certified system, participation in any delivery system reform (ACO, P4P, or PCMH), age, specially, practice size, ownership, metropolitan statistical area, and Census region. Physicians that were uncertain or did not enter the number of years they used an EHR were not included in the model (6.9% of those with an EHR system). Missing data for each attitude was removed resulting in different sample sizes for each question

Source: CDC/NCHS, National Electronic Health Records Survey, 2014. Marginal effects are presented from logistic regression, where estimates are adjusted for having a certified system, experience with using EHRs, participation in any delivery system reform (ACO, P4P, or PCMH), age, specialty, practice size, ownership, metropolitan statistical area, and Census region. Item nonresponse for EHR optimization was about 3% and was removed from the analysis. Missing data for each attitude was removed resulting in different sample sizes for each question.
