## SPECIAL NOTE

This report is intended for the information and administrative use of those involved in the investigation and control of poliomyelitis and polio-like diseases. It presents a summary of provisional information reported to CDC from State Health Departments, the National Office of Vital Statistics, Virology Laboratories, Epidemic Intelligence Service Officers, and other pertinent sources. Since much of the information is preliminary in nature, confirmation and final interpretation should be determined in consultation with the original investigators prior to any further use of the material.

## SUMMARY

In contrast to the previous week, a sharp decrease in total and paralytic cases of poliomyelitis was reported to NOVS during the week ending October 8.

A newly reported concentration of cases in New York State and the continuing outbreak in Baltimore City contribute to the weekly total.

A descriptive account from New York State and narrative reports from Maryland and Pennsylvania are included. In addition, results of further investigation of the Red Lake, Minnesota, outbreak are summarized.

## 1. CURRENT POLIOMYELITIS MORBIDITY TRENDS

The National Office of Vital Statistics was notified of a total of 131 cases of poliomyelitis, 101 paralytic, during the 40 th week ending October 8. This represents a sharp decrease from the number reported the previous week, and brings the national total in 1960 through October 8, to 2,435 cases, of which 1,662 ( $68.3 \%$ ) are paralytic.

Figure I shows the continuing downward trend in total and paralytic cases and illustrates the sharp decrease in reported cases this week. The decline during the past two weeks emphasizes the paralytic peak at week number 38.

The table below summarizes the current 6-week experience in poliomyelitis as compared with the past 4 years. Although the number of total cases is lower than any other in this period, the number of paralytic cases remains above that of 1957.

## POLIOMYELITIS

Total for 35th through 40th weeks for past five years

|  | 1960 | 1959 | 1958 | 1957 | 1956 |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Paralytic | 699 | 1,758 | 1,016 | 536 | 1,724 |
| Total | 1,059 | 2,735 | 2,142 | 1,464 | 4,742 |

The decrease in reported cases is reflected in all but 2 of the 9 major regions. An increase in total cases in the Middle Atlantic Region is due to a newly reported concentration of cases in Allegheny County, New York, and to delayed reporting from Pennsylvania. The Baltimore City outbreak and delayed case reports from North Carolina account for the increase noted in the South Atlantic Region.

## 2. REPORTS

## A. New York

There have now been 110 poliomyelitis cases reported in New York State, exclusive of New York City, with onsets in 1960. According to Dr. Robert M. Albrecht, Director, State Division of Epidemiology, 72 of these have been paralytic, 27 nonparalytic, and 11 unspecified as to paralytic status.

A nev concentration of cases has occurred in the western part of the State in Allegheny County (which has a population of approximately 47,000); 6 of the 10 cases have been paralytic. The cases are widely scattered throughout the county with no localization thus far. The first 3 cases had onset in July and 6 had onset in September; 2 are in the pre-school age group, 3 in the 5-9 age group, 2 in adolescents, and 3 in young adults. Only one patient is nonwhite, and 4 of the 8 with known vaccination status have had 3 or more vaccine doses. There have been 4 virus isolations of which 3 have been type I poliovirus.

Allegheny County is directly east of Cattaraugus County where a concentration of type III polio cases was recognized earlier this summer (PSU \#212). Cattaraugus County has now had a total of 26 cases, including 14 paralytic. There have been 12 type III poliovirus and 2 type I poliovirus isolations from these cases.
B. Pennsylvania

Of the 10 cases of polionyelitis reported to NOVS from Pennsylvania this week, 7 have had onsets since September 21 with none since October 3. Of the 7 cases, 2 have occurred in Cambria County, 1 each in Westmoreland and Venango Counties, and 3 in Allegheny County.

Of interest is a report received from Dr. I.F. Gratch, Chief of Epidemiology Section, Pennsylvania Department of Health, concerning the 3 Allegheny County cases. These are all paralytic, and the patients are schoolage children who have had 4 doses of $S a l k$ vaccine. Laboratory investigation is underway, and as yet no virus has been reported isolated. There is no concentration locally within the County.

## C. Maryland

There have been 15 new paralytic poliomyelitis cases reported to the Maryland State Health Department in the past week according to Dr. Charlotte Silverman, epidemiologist. Dr. Glen E. Gresham, EIS officer, assisting Dr . Silverman reports that 10 of these new cases have been in the city of Baltimore, while 2 cases each have occurred in Crellin (Garrett County) and Street (Harford County).

Baltimore now has accounted for 70 paralytic cases and 3 nonparalytic among the State total of 101 cases. Of the 70 paralytic cases 61 percent are pre-school children and 20 percent are in the school age group. Only 7 percent are adults. These paralytic cases are presented below by age and vaccination status:

| AgeGroup | Doses of Vaccine |  |  |  |  |  | Total |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 | 3 | 4 \% | Unk. |  |
| 0-4 | 19 | 5 | 6 | 7 | 1 | 5 | 43 |
| 5-9 | 6 | 0 | 2 | 5 | 2 | 0 | 15 |
| 10-14 | 1 | 0 | 0 | 4 | 0 | 0 | 5 |
| 15-19 | 0 | 0 | 0 | 0 | 0 | 0 | 0 |
| $20 \%$ | 7 | 0 | 0 | 0 | 0 | 0 | 7 |
| TOTAL | 33 | 5 | 8 | 16 | 3 | 5 | 70 |

Note that whereas 51 percent of the cases with immunization history known had no vaccine, 29.2 percent had 3 or more doses. There have been 33 cases among the white population for an attack rate of 5.3 per 100,000 and 37 Negro cases for a rate of 12.7 . Of the 19 persons with 3 or more vaccine doses 10 are white and 9 Negro.

Although the earlier cases were concentrated in lower socio-economic areas in the more central areas of the city, the recent cases have tended to be more scattered with evidence of a radial spread. Dr. Gresham reports that an active vaccination program is underway in Baltimore.
D. Minnesota

Dr. Herman Kleinman of Minnesota State Division of Disease Prevention and Control, has made available a follow-up summary of the outbreak reported among the Indians of the Red Lake Reservation in Northern Minnesota (PSU \#214). There have been 6 paralytic cases thus far, all among Indian children, with onsets as follows:

|  | Onset | Age | Sex | Vaccination Status | Virus <br> Type | Comment |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 1. | 8-13 | 7 | M | 4 | I | Last dose 8-5-60 not correlated |
| 2. | 8-21 | 3 | M | 0 | I |  |
| 3. | 8-28 | 5 mo . | M | 0 | I |  |
| 4. | 9-5 | 6 | M | 0 | I | Bulbo-spinal |
| 5. | 9-6 | 5 | F | 0 | ? |  |
| 6. | 9-12 | 20 mo . | F | 2 | I |  |

A seventh Red Lake child with paralytic polio no longer lives on the reservation and is felt to have been infected elsewhere. This is a 15 month old boy with onset 7-7-60 who has had type III poliovirus isolated. Vaccination status is unknown.

There have now been 40 cases in Minnesota with onsets in 1960, with 32 of these paralytic. No new case clusters have been reported. Note that Shakopee, where 3 cases occurred in one family, is in Scott County, south of Minneapolis, and not near Duluth as erroneously reported last week.

## 3. 1960 POLIOMYELITIS CASES REPORTED TO PSU

During the week ending October 10, 109 cases of poliomyelitis were reported on PSU forms to the Poliomyelitis Surveillance Unit. Of these, 78 were paralytic, 28 nonparalytic, and 38 unspecified. This brings the total reported to 1,732: 1,278 paralytic, 416 nonparalytic, and 38 unspecified.

The speci.fied cases are shown in the following tables:
TABLE 3
POLIOMYELITIS CASES BY PARALYTIC STATUS, AGE GROUP AND VACCINATION HISTORY REPORTED ON PSU FORMS

4. ROUTINE POLIOMYELITIS SURVEILLANCE
A. Cases with Onset within 30 Days of Vaccination

During the week ending October 10, 1960, the Polio Surveillance Unit received reports of 8 cases of poliomyelitis, all paralytic (none correlated), with dates of onset 30 days or less after Salk inoculation. This brings the yearly total to date to 103 cases, 79 paralytic (7 correlated).

The 8 paralytic cases are presented in Table II.
B. Vaccine Distribution

Table III shows a summary of current and cumulative shipments of poliomyelitis vaccine and quadruple antigen vaccine. The latter constitutes approximately $12 \%$ of the total domestic shipments in 1960 to date.
(This report was prepared by the Poliomyelitis and Polio-like Diseases Surveillance Unit, Joseph Oren, M.D., Chief, Michael J. Regan, M.D., and Mr. Leo Morris, Statistician, with the assistance of Statistics Section, CDC.)
