

## SUMMARY

There has been an increase in the number of poliomyelitis cases reported for the current week ending Occober 21 . A total of 59 cases, 39 paralytic, were reported compared to the 35 cases, including 20 paralytic, which were reported during the previous week.

Although there has been an increase in reported cases, they have been scattered geographically with no significant concentration. The only new cluster of cases noted is in Milwaukee County, Wisconsin. Narrative reports are included from Wisconsin, Louisiana, and Ohio.

## 1. CURRENT POLIOMYELITIS MORBIDITY TRENDS

Although an increase in reported cases occurred during the 42 nd week ending October 21, 1961, the total of 59 cases, 39 paralytic, remains quite low as compared to the same week in 1960 when 140 cases, 93 paralytic, were reported.

Six-week totals for the 37th through 42nd week, for the past five years are shown below:

Six-Week Totals (37th through 42nd week)

|  | 1961 | 1960 |  | 1959 | 1958 | 1957 |
| :--- | ---: | ---: | ---: | ---: | ---: | ---: |
|  |  |  |  |  |  |  |
| Paralytic | 243 | 650 | 1,587 | 1,038 | 533 |  |
| Total | 400 | 945 | 2,248 | 2,147 | 1,223 |  |

New York State reported nine cases which were from eight scattered counties, none having occurred in the Syracuse area. Ohio, Wisconsin, West Virginia and California reported five cases each, while Indiana, Missouri, North Carolina and Louisiana reported four. No current localized outbreaks are in progress; small aggregations have been noted in Wisconsin, Louisiana, and Ohio and are commented upon in Section 2. No new cases have occurred in Newberry County, South Carolina.
2. REPORTS
A. Wisconsin

The report of four paralytic cases and one nonparalytic case from Wisconsin this week brings the cumulative 1961 total for this State to 27. Thirteen of these cases have occurred in Milwaukee City or County. Poliomyelitis Surveillance Forms have been received on twelve of these patients and show all of the cases from this area to have been paralytic. This is shown as follows:

| Date of Onset | Age | Race | Sex | Vaccination Status | Paralytic Status | Laboratory Isolation |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 6/4 | 3 | N | M | OV | P | Type I |
| 7/22 | 10 | W | M | 3 V | P |  |
| 8/8 | 22 | W | F | OV | P |  |
| 8/11 | 6 mos. | W | M | OV | P | Type III |
| 8/15 | 17 | W | M | 3 V | P (Death) |  |
| 8/27 | 16 | W | M | 3 V | P |  |
| 9/1 | 32 | W | M | OV | P |  |
| 9/1 | 4 | W | F | 0 V | P | Type III |
| 9/2 | 6 | W | M | 2V | P |  |
| 9/10 | 3 | W | M | 0 V | P | Type III |
| 9/14 | 8 | W | M | OV | P (Death) |  |
| 9/30 | 18 | W | F | OV | P |  |

Only three of the twelve cases had received as many as 3 doses of inactivated poliovirus vaccine. Six of the twelve cases have had onset since September 1, 1961; no cases are reported as yet with onset in October.

## B. Louisiana

There have been 13 cases of poliomyelitis, 12 paralytic, reported by Louisiana during the past four weeks (See Table I). Poliomyelitis Surveillance Forms reveal that one paralytic case had occurred in each of eight parishes (counties) with the remaining four occurring in New Orleans.

There have now been 12 paralytic cases in New Orleans with onset in 1961. The 12 cases have occurred throughout the year as follows:

|  | Vaccination History |  |  |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Month of Onset | 0 | $1-2$ | $3+$ | Total |  |
|  |  |  | 0 | 0 |  |
| April | 1 | 0 | 0 | 0 |  |
| May | 3 | 0 | 0 | 0 |  |
| June | 2 | 1 | 0 | 3 |  |
| July | 1 | 0 | 1 | 3 |  |
| August | 2 | 0 | 1 | 2 |  |
| September | 9 | 1 | 2 | 3 |  |
| Total |  |  |  |  |  |

As shown above, 75 percent of the cases were unvaccinated and no more than three cases occurred in any one month. Ten of the 12 cases have been in the Negro population and all but 3 of the 12 cases have been under 7 years of age. Type I poliovirus has been isolated from 11 of the 12 cases; the 12th case yielded a Type III poliovirus. There have also been two cases of nonparalytic poliomyelitis, with onset in July, from which Type I poliovirus was
isolated. Follow-up reports received on 7 of the 12 cases show two cases with complete recovery, two with minor involvement and three with significant disability.

The Louisiana Weekly Report on Poliomyelitis compares 1961 to the past two years as follows:

Poliomyelitis Through 42nd week

|  | 1961 | $\underline{1960}$ | 1959 |
| :--- | ---: | ---: | ---: | ---: |
| Paralytic | 38 | 29 | 83 |
| Total | 48 | 48 | 120 |

C. Ohio

Dr. Winslow Bashe, Jr., Chief, Communicable Disease Division, Ohio Department of Health, has reported sixteen cases of poliomyelitis during the past four weeks. Of this total, 8 have been paralytic, 6 nonparalytic and 2 unspecified as to paralytic status. The 8 paralytic cases have occurred in 6 different counties. Of these cases, one had onset in August, 5 in September and 2 in October. Five of the 8 cases had received no inactivated vaccine, the other 3 were triply vaccinated.

Populous Franklin County (Columbus) has accounted for 6 paralytic cases during this year, the largest number of paralytic cases to occur in any one Ohio county during 1961. Of the 6 cases, 4 occurred prior to September and 2 occurred during the first week in October, both unvaccinated adults. There have been 4 Type I isolations made from the Franklin County cases.
(This report was prepared by James A. Bryan, II, M.D. and Mr. Leo Morris, Statistician, of the Poliomyelitis and Polio-like Diseases Surveillance Unit, with the assistance of Statistics Section, CDC.)
3. 1961 POLIOMYELITTS REPORTED TO PSU

Through October 21, there have been 817 cases of poliomyelitis, with onset in 1961, submitted on individual case forms to the Poliomyelitis Surveillance Unit. Of the 817 cases, 587 ( 72 percent) are paralytic, 198 nonparalytic and 32 unspecified as to paralytic status. These cases are presented below in Table 3 by paralytic status, age group and vaccination history.

The 817 cases submitted to PSU represent three-fourths of the 1,080 cases reported to CDC on the weekly telegraphic reports. This is shown in the following table.

|  | Poliomyelitis Through October 21, 1961 |  |  |
| :---: | :---: | :---: | :---: |
|  | Telegraphic Reports | PSU Forms | \% Received on PSU Forms |
| Paralytic | 693 | 587 | 84.7 |
| Nonparalytic | 256 | 198 | 77.3 |
| Unspecified | 131 | 32 | 24.4 |
| TOTAL | 1080 | 817 | 75.6 |

4. ROUTINE POLIOMYELITIS SURVEILLANCE
A. Cases with Onset Within 30 Days of Vaccination (Inactivated)

Two delayed reports of paralytic poliomyelitis within 30 days of receiving inactivated vaccine (IPV) have been received by the Poliomyelitis Surveillance Unit during the past week ending October 2l. Both cases occurred in Madison County, New York with onset in early August. The manufacturer and lot number of vaccine used is being investigated as part of routine poliomyelitis surveillance.

This brings the 1961 total of under 30-day cases (IPV) to 17, of which 13 are paralytic (two correlated).
B. Cases with Onset Within 30 Days of Vaccination (Oral)

An additional case of paralytic poliomyelitis within 30 days of receiving oral vaccine (OPV) has been reported to the Poliomyelitis Surveillance Unit during the past week ending October 21. This case, a 27-year old female, was fed Type I oral vaccine on August 30 and had onset on September 2, in Onondaga County, New York. This brings the 1961 total of under 30-day cases (OPV) to 27 , of which 22 are paralytic.

## C. Vaccine Distribution

A summary of current and cumulative shipments of poliomyelitis and multiple antigen vaccines through September, 1961, is presented in Table II. Also included in this report is Figure 2 which depicts the quarterly shipments of vaccine since 1955.

## 5. ENTEROVIRUS SURVEILLANCE

The non-polio enterovirus isolations reported to the Poliomyelitis Surveillance Unit from 1961 specimens were presented last week (PSU Report \#243). Since that time, the following note of interest has been received from the Boston area. This represents the second report this year from a laboratory source other than a state health department (the first stemming from Dr . G. D. Hsiung at Yale). This report will be incorporated into our next table of enterovirus isolation as will reports from any other source.

The following enterovirus isolations were made during the months of August and September and reported from the laboratory of Dr . John F . Enders, Research Division of Infectious Diseases, Children ${ }^{〔}$ s Medical Center, Boston. Specimens were obtained primarily from patients seen at the Children's Medical Center but also included material provided from other hospitals in the Boston area. The majority of cases were diagnosed clinically as aseptic meningitis and were shown to be due to four Coxsackie viruses, Coxsackie $\mathrm{B}_{5}$ predominating.

| Clinical <br> Syndrome | Patients Studied | Virus <br> Isolations | Percent Isolations | Agents <br> Identified | No. <br> Isolated |
| :---: | :---: | :---: | :---: | :---: | :---: |
| Aseptic Meningitis | 47 | 23 | 49 | Coxsackie A | 1 |
|  |  |  |  | Coxsackie $\mathrm{B}_{2}$ | 2 |
|  |  |  |  | Coxsackie $\mathrm{B}_{4}$ | 2 |
|  |  |  |  | Coxsackie $\mathrm{B}_{5}$ | 10 |
|  |  |  |  | Untyped | 8 |
| Cerebellar Ataxia | 1 | 1* | - | Coxsackie $\mathrm{B}_{4}$ |  |
| Guillian - Barre | 1 | 1* | - | ECHO (Untyped) |  |
| Syndrome Encephalitis | 1 | 1* | - | Coxsackie $\mathrm{B}_{4}$ |  |

* Isolation from both stool and throat swab.

Of the 23 isolations from the cases of aseptic meningitis, the following table shows the specimens processed.
