SPECIAL NOTE
This report is intended for the information and administrative use of those involved in the investigation and control of poliomyelitis and polio-like diseases. It presents a summary of provisional information reported to CDC from State Health Departments, Virology Laboratories, Epidemic Intelligence Service Officers, and other pertinent sources. Since much of the information is preliminary in nature, confirmation and final interpretation should be determined in consultation with the original investigators prior to any further use of the material.

## SUMMARY

Reports of poliomyelitis remained at the unseasonable low noted last week. The 36th week of the year ending September 9, brought news of 62 cases.

Cases continue to occur in the Syracuse, New York area. Pennsylvania reported seven cases but noted no concentration.

Recent Coxsackie isolations made in epidemics of febrile disease and aseptic meningitis are reported in Section 5.

Increased poliomyelitis has been reported from several neighboring countries to the South. These figures will be presented in Section 6.

## 1. CURRENT POLTOMYELITIS MORBIDITY TRENDS

The reported total of cases of poliomyelitis for the $36 \mathrm{tr}_{\mathrm{i}}$ week remained at the level reported last week. A total of 62 cases, 37 paralytic, was included in telegraphic reports. The previous weekis total was 60 cases with 36 paralytic.

Case totals cumulated weekly through the 36 th week for this year and the preceding four years are shown below. Paralytic cases reported this year represent only $38 \%$ of similar cases in 1960, the low of recent years.

Polio (Cumulated Weekly) through 36th Week for Past Five Years

|  | 1961 | $\underline{1960}$ | $\underline{1959}$ | $\underline{1958}$ | $\underline{1957}$ |
| :--- | ---: | :--- | :--- | :--- | :--- | :--- |
| Paralytic | 454 | 1200 | 3122 | 1262 | 1305 |
| Total | 685 | 1735 | 4956 | 2597 | 41.62 |

Only two States, New York and Pennsylvania, reported over three cases. Aside from continuing cases in upper New York State, there have been no epidemic concentrations noted.

## 2. REPORTS

A. New York State

Dr. Robert M. Albrecht, Director, Office of Epidemiology, New York State Department of Health, reports that 15 additional paralytic cases of poliomyelitis have been recognized during the past week in Onondaga, Madison, and Oneida Counties. Through Wednesday, September 13, 60 cases of paralytic poliomyelitis have occurred in this tri-county area. Of these cases, 34 have occurred in Onondaga County (22 in Syracuse), 15 in Madison County, and 11 in Oneida County. Type I poliovirus has been isolated from seven of these cases.

The 60 paralytic cases are shown below by week of onset and by county. Cases continue to occur in Onondaga County while the last case to occur in either Madison or Oneida County was on September 1.

| County | Before July | 7/29 | 8/5 | 8/12 | 8/19 | 8/26 | 9/2 | 9/9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Onondaga | 1 | 1 | 2 | 1 | 4 | 10 | 11 | 4 |
| Madison | 1 | 0 | 4 | 3 | 5 | 2 | 0 | 0 |
| Oneida | 1 | 0 | 2 | 2 | 2 | 3 | 1 | 0 |
| TOTAL | 3 | 1 | 8 | 6 | 11 | 15 | 12 | 4 |

The tri-county area was the scene of an intensive immunization program from August 29-31. Over 400, 000 doses of type 1 oral poliovaccine were fed during this period. The total population of the three counties is 742,000. The epidemic curve shown below depicts the outbreak by date of onset in three-day intervals. The three days in which the oral vaccine was administered are marked. The histogram includes the 56 paralytic and 12 nonparalytic cases occurring since August 1.

POLIOMYELITIS BY DATE OF ONSET
ONONDAGA-MADISON-ONEIDA
COUNTIES, NEW YORK

Fifteen paralytic cases have had onset since the oral immunization program began. All but one of the 15 cases are from Onondaga County. Of the 15 cases, 11 received oral vaccine as shown below:

Interval in Days Between Oral Vaccine and Onset of Symptoms
$\frac{\text { No }}{\text { Vaccine }}$

4

| Same Day | $\underline{1}$ | $\underline{2}$ | $\underline{3}$ | $\underline{4}$ | $\underline{5}$ | $\underline{6}$ | $\underline{7}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 2 | 0 | 2 | 3 | 1 | 1 | 1 | 1 |

In addition to the 60 paralytic cases, there are six nonparalytic cases in Onondaga County, five in Oneida County and one in Madison County. There have been two deaths. The age and vaccination history of the 60 paralytic cases are shown in the following table:

| Age <br> Group | Vaccination History |  |  |  |  | TOTAL | \% |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | 0 | 1 | 2 | 3 | $4+$ |  |  |
| 0-4 | 11 | 2 | 4 | 8 | 4 | 29 | 48.3 |
| 5-9 | 1 | 0 | 3 | 4 | 3 | 11 | 18.3 |
| 10-19 | 2 | 0 | 2 | 1 | 2 | 7 | 11.7 |
| 20-29 | 3 | 1 | 0 | 2 | 1 | 7 | 11.7 |
| 30-39 | 5 | 0 | 0 | 1 | 0 | 6 | 10.0 |
| TOTAL | 22 | 3 | 9 | 16 | 10 | 60 | 100.0 |

## B. Pennsylvania

The seven cases of poliomyelitis reported this week include four widely scattered paralytic cases. According to Dr. I. F. Gratch, Epidemiologist, Pennsylvania State Department of Health, one of the paralytic cases was an unvaccinated 41 year-old white female from Dauphin County who had onset of paralytic disease on August 18 and died on August 27. This patient had not participated in the mass immunization program carried out earlier this year in Dauphin County. The corrected Pennsylvania State total now stands at 23 cases.

## 3. 1961 POLIOMYELITIS CASES REPORTED TO PSU

Through September 9, there have been 474 cases of poliomyelitis with onset in 1961 submitted on individual case forms to the Poliomyelitis Surveillance Unit. Of these 474 cases, 366 are paralytic, 94 nonparalytic, and 14 unspecified as to paralytic status.

These cases are presented in Table 3 by paralytic status, age group and vaccination history.

## 4. ROUTINE POLIOMYELITIS SURVEILLANCE

## A. Cases with Onset within 30 Days of Vaccination

No additional cases of poliomyelitis within thirty days of vaccination have been reported to the Poliomyelitis Surveillance Unit during the past week ending September 9. Thus, the 1961 total remains at nine cases, of which seven are paralytic (one correlated).

## 5. ENTEROVIRUS SURVEILLANCE

Notification of a number of Coxsackie B-4 isolates in New Haven and surrounding areas has been received from Dr. G. D. Hisiung, Director, Virus Diagnostic Laboratory, Yale University School of Medicine. Fourteen isolates have been obtained since May. The clinical features of those infected, varied from inapparent infection in one family contact to bronchiolitis, pneumonia, pericarditis, myalgia, aseptic meningitis, and encephalitis in hospitalized patients. One patient exhibited herpangina and gastroenteritis. The majority of the 1.3 patients hospitalized since May were infants and preschool age children. Aside from a cluster of four cases in one family, there is no evidence of concentrations within New Haven.

An outbreak of aseptic meningitis in North Dakota is also under investigation. Mr. Kenneth Mosser, Director of Preventable Disease Fivision, North Dakota State Department of Health, reports that four foci have been recognized: Bismarck (three cases), Garrison ( 12 cases), Minot (six cases), and Dickenson (four cases). The clinical features of these 25 cases included fever, malaise, nausea, headache, myalgia, and stiff neck. No exanthem or pleurodynia has been evident, but several instances of minor febrile illness in family contacts have been noted. The majority of cases occurred in preschool and school age children. Laboratory studies carried out by the CDC Kansas City Virology Laboratory, under the direction of Dr . Tom Chin, have yielded Coxsackie B-5 isolates in several cases. This same Coxsackie type has been obtained from several cases of aseptic meningitis in Fort Dodge, Iowa, and from one case of pleurodynia in Des Moines, Iowa.

## 6. POLIO IN THE HEMISPHERE

With the marked decrease in reported poliomyelitis in the United States, it is of interest to note poliomyelitis trends for various other countries in this Hemisphere which are north of the equator.

Reported Poliomyelitis Cumulated Through the 34th Week

|  | $\underline{1961}$ | $\underline{1960}$ |
| :--- | :---: | ---: |
| Colombia | 108 | 99 |
| Costa Rica | $6 \%$ | 32 |
| Cuba | 215 | 102 |
| El Salvador | 3 | 7 |
| Guatemala | 131 | $28 \%$ |
| Honduras | 23 | 15 |
| Mexico | 245 | 414 |
| Nicaragua | 13 | 189 |
| Panama | 20 | 20 |
| Venezuela | 97 | 225 |

Five of the ten countries show a lower incidence this year, while two others show the same oronly a minimal increase in reported cases. Cuba, Guatemala and Honduras show a higher incidence during the first 34 weeks.

Total cases reported during the past four years from five of these countries are presented below as reported in the World Health Organization ${ }^{\circ}$ S Epidemiological and Vital Statistics Report, Vol. 14, Number 3, Pages 92 and 93, with the 1960 totals for Cuba and Mexico kindly supplied by Dr. Puffer of the Pan American Sanitary Bureau. Experience during recent years in these countries shows a biennial increase in reported cases, with the exception of Cuba, which shows a steady increase in cases reported since 1957.

## TOTAL CASES

|  | 1960 | 1959 |  | 1958 | 1957 |
| :--- | ---: | ---: | ---: | ---: | ---: |
|  | 328 | 288 | 103 | 97 |  |
| Costa Rica | 66 | 41 | 63 | 51 |  |
| Guatemala | 78 | 155 | 85 | 107 |  |
| Mexico | 1087 | 1835 | 904 | 1562 |  |
| Nicaragua | 211 | 16 | 255 | 68 |  |

(This surveillance report was prepared by the Poliomyelitis and Poliolike Diseases Surveillance Unit, Michael J. Regan, M.D., Chief, James A. Bryan, II, M.D., and Mr. Leo Morris, Statistician, with the assistance of Statistics Section, CDC.)
