

PHILADELPHIA POLIOMYELITIS - 1963  
BY WEEK OF ONSET OF ILLNESS

Shown above is the epidemic curve to date. Following the occurrence of sporadic cases during June and July, an abrupt increase in cases occurred early in August. Twenty Type I isolations have been made.

Although cases are reported from eight of Philadelphia's ten health districts, more than one-half (22) of the cases are concentrated in one health district (see table below).

POLIOMYELITIS - PHILADELPHIA - 1963  
By Health District

Health Districts	Population (1960 Census)	Total Cases
1	96,545	1
2	200,974	2
3	203,984	2
4	197,224	3
5	192,319	6
6	154,894	24
7	253,655	2
8	233,707	2
9	265,238	0
10	202,241	0
		42

Inadequately vaccinated pre-school age children comprise the majority of poliomyelitis victims in the Philadelphia outbreak, as seen in the following table. (Reported by Dr. Eugene A. Gillis, Commissioner, Philadelphia Department of Public Health and Dr. I. F. Gratch, Pennsylvania State Department of Health).

POLIOMYELITIS - PHILADELPHIA - 1963  
By Age and Inactivated Vaccine Status\*

Age	OV	1-2V	3V	4+V	Total
Under 1	2	-	-	-	2
1	7	3	1	-	11
2	3	1	-	-	4
3	5	1	-	-	6
4	-	2	-	-	2
5-9	3	3	2	3	11
10-19	2	-	1	1	4
20 and over	2	-	-	-	2
Total	24	10	4	4	42

\*None of these children are known to have received oral polio vaccine.

EPIDEMIOLOGICAL REPORTS

Dengue Fever - Puerto Rico

The outbreak of dengue fever in Puerto Rico (See MMWR, Vol. 12, page 278) has been identified by serological study of acute and convalescent sera as due to a Group B arbovirus, presumably of the dengue virus complex. Specific etiologic diagnosis will depend on virus isolation and identification. Through September 4, a total of 3,551 cases have been officially reported from 31 of the 76 *municipios* of the Commonwealth.

Field studies now indicate that occasional clinically characteristic cases were occurring in late July, although the source and site of the initial introduction have not yet been determined. The presence of dengue, however,

was not recognized until early August when an outbreak of clinically characteristic cases was reported from Manati, a community on the north central coast of the Island. Within the next week, groups of similar cases were recognized in neighboring areas and also in the mountainous community of Juncos in the Eastern part of the island.

Reports continued to be received from new areas until September 4; outbreaks consisting of 25 or more officially reported cases had been recognized in 14 *municipios*.

AREAS WITH 25 OR MORE CASES

Municipio	Population*	Reported Cases Through September 4
Arecibo	69,879	528
Barceloneta	19,334	555
Bayamon	72,221	63
Guayama	33,678	325
Hatillo	20,238	62
Humacao	33,381	40
Juncos	21,486	213
Manati	29,354	690
Morovis	18,094	211
Rio Piedras	251,384	146
San Sebastian	33,451	41
Vega Alta	17,603	58
Vega Baja	30,189	336
Villalba	16,239	34

\*1960 Census

It is believed that the disease incidence is considerably under reported and may well be present in areas not yet reporting cases.

Limited surveys in neighborhoods in which cases are known to have occurred have revealed the prevalence of an acute febrile disease of varying severity, lasting 5-7 days and characterized by sudden onset, generalized myalgia, retro-orbital pain and often by rash. Crude attack rates from 25 to 40% have been estimated. Both

children and adults have been involved without predilection for particular age groups. Often whole families have been attacked typically, secondary cases following a week or more after the index case.

Entomological surveys have revealed the widespread occurrence of *Aedes aegypti* within and surrounding the dwellings in the epidemic areas. The prevalence of this species has been noted in various places with a frequency considerably higher than has been recorded in past surveys.

An island-wide program of health education has been directed at the individual householders, urging the spraying of their homes and the elimination of both indoor and outdoor breeding sites. The established mosquito control activities of the Department of Health have been strengthened.

(Reported by Victor Gonzalez, M.D., Director, Bureau of Health, Puerto Rico Department of Health, and a team from the Communicable Disease Center.)

Suspect Western Encephalitis

Outbreaks of suspect and confirmed cases of Western Encephalitis have been reported among humans and horses in the High Plains area of Texas and Saskatchewan. Sporadic cases only among horses have been noted in North Dakota and Wyoming.

In Texas, a marked decrease in the incidence of suspected cases of encephalitis has been noted in Hale County during the past week. The 1963 total for this region is now 50 with the reports of four new human suspect cases this past week. No deaths or additional horse cases were reported this week. There is serological evidence that Western Encephalitis is active in this area, but there have been no virus isolations as yet. Further laboratory studies are in progress. (See MMWR, Vol. 12, page 278).

(Continued on page 292)

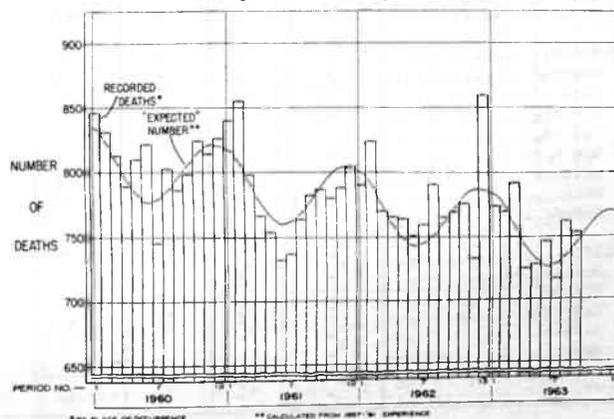

INFANT DEATHS IN 108 CITIES

The weekly average number of infant deaths in 108 cities for the four-week period ending August 31 was 753 as compared with an expected weekly average of 744.

TOTAL DEATHS UNDER ONE YEARS OF AGE IN 108 CITIES

	WEEK ENDING				4 Week Total	Weekly Average
	8/10	8/17	8/24	8/31

\*Estimate - based on average percent of divisional total.  
Totals for previous weeks include reported corrections.

NOTE: All deaths by place of occurrence.

In Saskatchewan, an endemic area for Western Encephalitis, over 220 confirmed cases of Western Encephalitis in horses have been reported during the past two weeks. The outbreak is the largest in recent years. More than 50 cases of an encephalitic illness in humans have been reported during this same period. The illness is characterized by respiratory symptoms and lymphadenopathy for 7-10 days, followed by abrupt onset of high fever and clinical encephalitis. All age groups have been affected; however, the illness has been most severe in elderly persons and pre-school age children. Laboratory studies are in progress.

*(Reported by Dr. J. E. Peavy, State Commissioner of Health, Texas Department of Public Health; Kenneth Mosser, Director, Division of Preventable Diseases, North Dakota State Department of Health; Dr. H. O. Dillenberg, Provincial Epidemiologist, Department of Health, Saskatchewan, Canada; and a team from the Communicable Disease Center.)*

## INTERNATIONAL NOTES

### Smallpox - Hungary

One case of smallpox has occurred in Budapest, which has been declared infected with smallpox as of August 31.

All travellers to Budapest are advised to have had a successful vaccination within the past six months; travellers otherwise, may be subject to detention.

### Smallpox - Switzerland

One laboratory-confirmed case of smallpox has been reported from Zurich in a patient who arrived in Switzerland from a foreign area. Zurich has been declared a non-infected local area.

### Smallpox - Poland

No further cases of smallpox have been reported from Poland as of August 29, according to the World Health Organization. A total of 110 cases, including 7 deaths, has been reported to date. The last recognized cases were hospitalized August 11.

More than six and one-half million vaccinations were given during the epidemic.

Poland has declared Opole free of smallpox as of August 30.

### Dengue Fever - Jamaica

Only two cases of dengue fever were reported for the week ending August 17, 1963, bringing the cumulative total for 1963 to 111 cases. (See also Dengue Fever, Puerto Rico.)
