^aAntibiotic exposure defined for cases as meeting any of the following criteria: having a positive serum bioassay, received antibiotics at a referral facility, or administered antibiotics at the study facility prior to the collection of specimens (assessed by clinician report and time/date calculation); for controls as having a positive serum bioassay. Participants with unknown antibiotic exposure data are excluded from these analyses.

^bRelative odds of culture positivity (vs. no growth of any organism) given antibiotic pretreatment, compared to those who are not pretreated. Odds ratios were adjusted for site, severity, blood culture specimen volume >3mL, and age category. Respiratory specimens (NP, IS) in cases were adjusted for the same variables with the exception of blood specimen volume; NP in controls was adjusted for age category and HIV-status.

^cExcluding contaminants.

^dNo quality stringency criteria applied.

^eOther gram negative rods isolated from induced sputum includes *Acinetobacter* spp., *Enterobacter aerogenes*, *Enterobacter cloacae*, *Pseudomonas aeruginosa* and species, and mixed gram negative rods.

^bRelative odds of laboratory outcome given antibiotic exposure, compared to those who were not pretreated. Odds ratios are adjusted for site, severity, CXR status, HIV-infection status, and age. NP/OP outcomes in controls are adjusted for site, HIV-infection status, and age.

^cFold-difference in mean log₁₀ transformed PCR density (copies/mL) for pretreated compared to non-pretreated individuals, among those PCR positive.

^dAbove PCR density threshold (6.9 log₁₀ copies/mL) associated with case status (Baggett et al., this supplement).
