

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED SEPTEMBER 28, 1963

POLIOMYELITIS – Twenty cases of poliomyelitis, 10 paralytic, were reported for the week ending September 28. Seven cases were reported from Pennsylvania and four from Michigan. Two cases each were reported from Illinois and Mississippi, while New York, Minnesota, Virginia, Kentucky and Alabama reported single cases.

Five of Pennsylvania's cases were from Philadelphia, and occurred before the mass immunization program was held in that city (see MMWR, Vol. 12, pp. 285, 293, 301). Philadelphia has had 49 cases thus far in 1963. Of Michigan's cases, two were from Grand Rapids, bringing that city's total to five. A mass immunization program, with over a 90 per cent response, was held in Grand Rapids, September 21 (see MMWR, Vol. 12, p. 293). Thus far in 1963, 285 cases have been reported. This total represents less than one-half the number of polio cases reported for the comparable period of 1962, which was the lowest year on record.

BOTULISM – Five cases of botulism, including one death, were reported from Kentucky for the week ending September 28. This brings the total number of cases of botulism to 17 thus far in 1963, accounted for by five separate outbreaks. Outbreaks in Michigan and West Virginia have been previously described. (See MMWR, Vol. 12, pp. 95 and 311.) Reports on outbreaks in Kentucky and California are described in this week's Epidemiological Reports.

EPIDEMIOLOGICAL REPORTS

Botulism - Kentucky

Five members of a Mayslick, Kentucky, family of ten became ill with symptoms characteristic of botulism following a Saturday night supper which consisted of home preserved corn.

LETTICE.

On September 14, the mother opened a quart sized jar of the corn, which she had cold packed approximately one month earlier. The corn was served in varying quantities to seven members of this family. Five became ill from 18 to 60 hours following the meal. The severity of the symptoms appeared to correlate with the amount consumed.

The fatality occurred in a 12-year-old daughter who began experiencing vomiting, diarrhea, diplopia, dysphagia, generalized weakness, and respiratory difficulty about 18 hours after she had eaten two dishes of the corn. Three days after ingestion she was taken to a local physician who prescribed chewing tobacco for her vomiting. The following day she was taken to another physician who diagnosed botulism and prescribed antitoxin; but the patient died on Friday, September 20. Autopsy demonstrated only hyperemia of the brain.

The four other victims included the mother and three children. The mother ate one dish of the corn. Two days later she experienced diplopia, dysphagia and weakness without vomiting or diarrhea. A 14-year-old son ate the contents of one dish and two additional tablespoons of corn. He developed diarrhea, diplopia, dysphagia and weakness 48 hours later. He also experienced "asthmatic breathing" which responded to adrenalin. A 9-year-old daughter consumed a dishful of the corn. About 60 hours later, she began to experience diplopia, nasal speech, a sore throat, vomiting, diarrhea, and weakness. A five-yearold daughter consumed no more than two teaspoons of the corn, yet developed diarrhea, dysphagia, diplopia, and muscle weakness. All received bivalent antitoxin.

Two other members consumed very small quantities of the corn and demonstrated symptoms to a minor degree, only. The father ate less than one teaspoon of the corn. He experienced diarrhea and abdominal cramping, as well as a tightness in his throat, but was not officially reported as a case. Although the father noted that the corn tasted bad and smelled worse, he did not actively prevent the other members of the family from eating this particular food.

Three other children in the family were asleep during the meal and did not consume any corn; none of these three became ill at any time.

Corn from the family garden had been cold packed in sterilized jars and boiled for four and one-half hours, then allowed to cool after the addition of salt. In addition to the quart jar, four half gallon jars were also prepared and stored in the family chicken coop. At one time during the period of storage, the jar tops were changed in the coop.

All of the contents of the quart jar were consumed by the family. The jar was cleaned with detergent by the mother and was not available for lab studies. The four other half gallon jars of corn remained and were submitted for laboratory studies. In one of these four remaining jars, Type B toxin was demonstrated and C. botulinum was cultured, according to preliminary laboratory tests.

(Reported by J. Clifford Todd, M.P.H., State Epidemiologist. Kentucky, and an EIS Officer.)

Botulism – California

Six cases of botulism, including one death, were reported from California (See MMWR, Vol. 12, page 302) following a 25th anniversary dinner celebration for a Parish priest. The dinner, held June 30, was attended by 300 people. The source of the botulism outbreak appears to have been home canned mushrooms.

A 47-year-old female, who attended the affair, noted double vision approximately 26 hours following the meal. Two days later, because of difficulty in speaking and swallowing, she was admitted to a hospital. On the sixth day after the meal, the patient died following an angiogram to rule out a suspected brain tumor. An autopsy was performed but did not reveal the cause of death. The coroner's office, however, reported the case as possible botulism; an epidemiological investigation began. At that time, it was learned that another patient in a different hospital, who had symptoms of double vision and difficulty in swallowing and talking, had also attended the same affair. This patient's physician had diagnosed botulism and had administered botulinus antitoxin. The brother of this same patient experienced similar symptoms but was not hospitalized. Three others attending the dinner were found to have symptoms consistent with botulism. None of these four received antitoxin. Another patient, who complained of spots before her eyes and numbness of tongue and teeth, was diagnosed as not botulism.

A wide variety of foods were served at this buffet dinner. The mushrooms appear implicated on the basis of the attack rates below:

CALIFORNIA BOTULISM

Person	s Eatir	ng Liste	d Food	Persons Not Eating Listed Food				
Food	Total	No. III	Attack Rate	Total	No. III	Attack Rate		
Mushrooms	24	7	29%	117	0	0%		
Sausage	107	4	4%	35	3	9%		
Ham	114	7	6%	26	0	0%		
Turkey	54	1	2%	84	5	6%		
Corned Beef	17	0	0%	24	7	6%		
Olives	56	1	2%	78	3	4%		
Cheese Cake	48	2	4%	89	4	4%		

The woman in charge of the food preparation did not know the source of the mushrooms. Her husband received a number of jars, including the mushrooms, from an unidentified woman, whom he presumed was a Parish member. Yet no member acknowledged this contribution. A kitchen worker remembered emptying three quart jars of home prepared mushrooms into a bowl for serving. No mushrooms remained following the meal. Although all seven individuals who had nervous system symptoms ate the mushrooms, several other persons did likewise. Many who tasted the mushrooms thought they were not good and did not eat them.

Samples of the remaining food, including bologna, salami, sausage, cream cheese, and turkey were submitted to the Los Angeles City Health Department Laboratory, as well as to the Food and Drug Administration Laboratories. All samples were negative for cultures of *Clostridium botulinum*. Injection of suspensions of the food into mice did not cause a single fatality.

Los Angeles City Health Department officials presumed that the mushrooms were improperly home prepared. The probability that only one of the three jars of mushrooms was contaminated with *C. botulinum* may have accounted for the lack of symptoms in those who ate the mushrooms but remained well.

(Reported by F. A. Listick, Sanitarian, Los Angeles City Health Department, and Philip K. Condit, M.D., Chief, Bureau of Communicable Discases, State Department of Health, Berkeley, California.)

Dengue Fever - Puerto Rico

As of September 30, a total of 12,962 cases of dengue fever had been reported to the Puerto Rico Department of Health. This represents an increase of 1,621 cases during the past week. The predominant number of cases continue to be received from relatively few of the *municipios*. Of 77 *municipios*, 66 have reported cases; 11, however, account for 76 percent of the total. Even in those reporting the largest numbers of cases, neither high school absenteeism nor hospital admissions have shown notable increases.

INFANT DEATHS IN 108 CITIES

The weekly average number of infant deaths in 108 cities for the four-week period ending September 28 was 736 as compared with an expected weekly average of 755.

TOTAL DEATHS UNDER ONE	YEAR	OF	AGE
IN 108 CITIES			

		WEEK	ENDI	IG	4 Week	Weekly		
	9/7	9/14	9/21	9/28	Total	Average

Expected	751	754	756	759	3,020	755		
Excess	- 62	51	- 49	- 18	- 78	- 19		

A morbidity survey, utilizing a random sample of 177 households, was conducted in the township of Guaynabo on September 24 and 25 to determine the current attack rate of dengue-like illness in that community. Interviews completed on 171 households of the 591 households in the Guaynabo study area, reveal an attack rate of 17.6 percent for the period August 1 through September 24.

AGE-SPECIFIC ATTACK RATES: DENGUE-LIKE ILLNESS GUAYNABO, PUERTO RICO AUGUST 1 - SEPTEMBER 24, 1963

	POPULATION				CASE	ES	diam	A.R. (%)

*Estimate - based on average percent of divisional total. Totals for previous weeks include reported corrections.

335 741 6,111

The 153 cases are shown by week of onset in the figure on page 323. Nine cases appeared in early August followed by a progressive increase in cases in late August and early September. It is uncertain as to whether the peak of the outbreak in this community has yet been reached. Additional surveys will be conducted in subsequent months.

(Reported by Victor Gonzales, M.D., Director, Bureau of Health, Puerto Rico Department of Health, and a team from the Communicable Disease Center.)

INTERNATIONAL NOTES

Polio - Canada

Five new cases of poliomyelitis were reported in Quebec for the week ending September 21, 1963, bringing the corrected total thus far in 1963 to 68. (See MMWR, Vol. 12, page 301.) Only 6 cases of polio have been reported in the other Canadian provinces thus far in 1963. Two cases each have been reported from New Brunswick and Alberta. Ontario and Saskatchewan have reported single cases.

In 1962, there were 76 Canadian poliomyelitis cases for the comparable period. Forty-four of these were from Quebec.

Dengue Fever – Jamaica

Four hundred and sixty-six cases of dengue have been reported in Jamaica through September 14 of this year. Dengue appears to have been on the wane during the past four weeks.

Smallpox - Hungary

Hungary has declared Budapest free of smallpox as of September 25. One non-imported smallpox case had been isolated on August 27, but investigation failed to reveal the origin of infection of this case.

Budapest was the last remaining smallpox infected local area in Europe.

Cholera - Korea

The first confirmed case of cholera occurred in Pusan September 17. As of September 21, 53 cases with 10 deaths were reported.

In Seoul, one confirmed local case of Cholera El Tor occurred September 22.

These represent the first reports of cholera in Korea since 1937.

Cholera — Japan

One imported cholera case was diagnosed September 18 in Yokohama. The victim was among 54 crew members of the S. S. Gurung Kerinitji, which had left Djakarta August 20, Hong Kong September 9, and which arrived in Yokohama September 16. The source of infection is being investigated.

Notes: These provisional data are based on weekly telegrams to the Communi-cable Disease Center by the individual State health departments. Symbols: --- Dete not evailable Quantity zero

Procedures for construction of various mortality curves may be obtained from Statistica Section, Communicable Disease Center, Public Health Service, U.S. Department of Health, Education, and Weilster, Atlanta 22. Georgia.
