

National Enteric Disease Surveillance: Shiga toxin-producing *Escherichia coli* (STEC) Annual Report, 2014

The Laboratory-based Enteric Disease Surveillance (LEDS) system contributes to the understanding of human Shiga toxin-producing *Escherichia coli* (STEC) in the United States by collecting reports of infections submitted by state and regional public health laboratories.¹ Reporting to LEDS is voluntary; the number of laboratories submitting reports varies somewhat from year to year, although almost all public health laboratories report every year. Occasionally, more than one isolate is reported from a single episode of infection in a person; this report includes only one isolate of a given STEC serogroup per person within a 30-day period.

An overview of surveillance methods and systems for Shiga toxin-producing *Escherichia coli* (STEC) infections is available at <http://www.cdc.gov/ncezid/dfwed/PDFs/national-stec-surveillance-overview-508c.pdf> (1).

Data in this report are current as of February 8, 2017.

Summary

- In 2014, 51 state and regional public health laboratories reported 4,437 cases of culture-confirmed Shiga toxin-producing *Escherichia coli* (STEC) infections and 999 STEC infections of unknown serogroup to LEDS, 3% fewer and 1% more than in 2013, respectively.
- Whereas incidence of infection due to non-O157 serogroups continued to rise in 2014 (0.79 cases per 100,000 population), serogroup O157 infection incidence continued to decline (0.60 cases per 100,000 population in 2014), and overall national incidence of culture-confirmed STEC continued to decrease (1.39 cases per 100,000 population in 2014).
- Children 1–4 years old had the highest incidence of infection of all age groups for both O157 and non-O157 serogroups.
- Infants (<1 year old) had the largest difference in incidence between O157 and non-O157 serogroups of all age groups (1.19 vs. 1.97 cases per 100,000 population for girls and 0.69 vs. 2.18 cases per 100,000 population for boys).
- At least half of states in the Midwest and West regions² had incidence above the national average for culture-confirmed infection due to O157 and non-O157 serogroups (including IA, MN, MO, ND, SD, and WI in the Midwest and CO, HI, ID, MT, NM, OR, UT, WA, and WY in the West)
- The largest percentages of infections for both O157 and non-O157 serogroups were reported in the summer months.

¹The practice of testing diarrheal stools for Shiga toxin without concomitant bacterial culture and serotyping has increased in recent years (2). The LEDS system is unable to differentiate reports of culture-confirmed STEC infection of unknown serogroup from reports of STEC diagnosed only by non-culture methods.

²Geographic regions in this report are consistent with those defined by the United States Census Bureau (https://www2.census.gov/geo/pdfs/maps-data/maps/reference/us_regdiv.pdf)

Figure 1. Incidence rate of human Shiga toxin-producing *Escherichia coli* (STEC) infection reported to LEDS, by serogroup and year, United States, 1996–2014¹

¹The “Total” category includes culture-confirmed infections of serogroup O157, non-O157 serogroups, and rough isolates.

²When isolates are rough, the O group is not expressed and cannot be determined by phenotypic methods. These isolates can be O157 or non-O157.

³The “Unknown” category includes cases diagnosed by culture-based methods where an isolate was never serogrouped and may also include cases diagnosed by culture-independent diagnostic tests (CIDTs).

Table 1a. Culture-confirmed human STEC infections reported to LEDS, with the 10 most frequently reported serogroups listed individually, United States, 2014

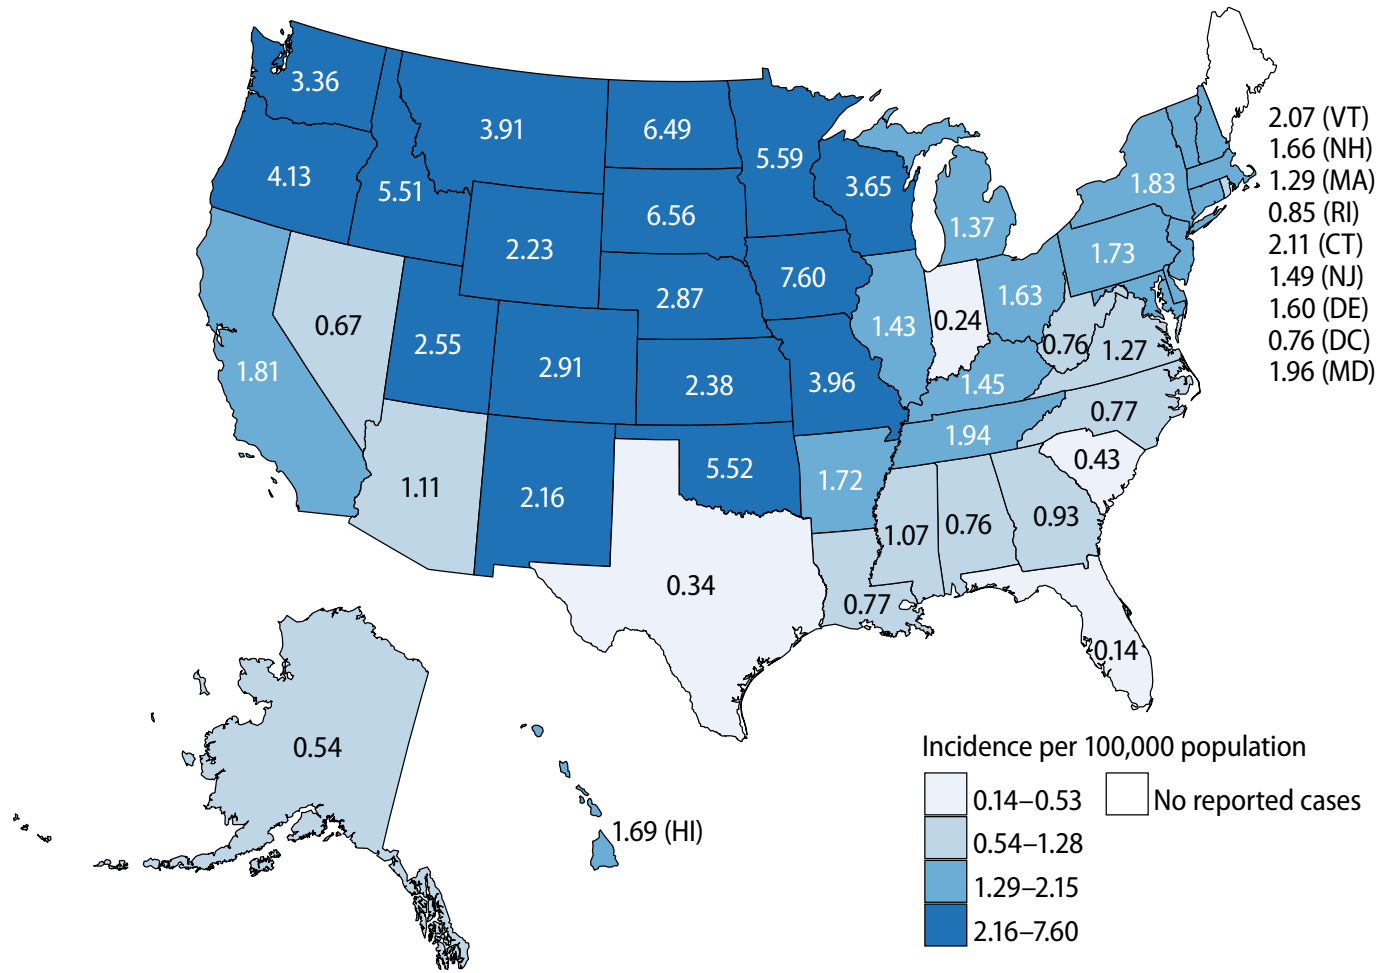

Rank	Serogroup	Number reported	Percent	Incidence per 100,000
1	O157	1,919	43.2	0.60
2	O26	722	16.3	0.23
3	O103	631	14.2	0.20
4	O111	501	11.3	0.16
5	O121	162	3.7	0.05
6	O45	114	2.6	0.04
7	O145	112	2.5	0.04
8	O186	42	0.9	<0.01
9	O118	33	0.7	<0.01
10	O69	17	0.4	<0.01
	Non-O157, other serogroups	161	6.4	0.05
	Subtotal, all non-O157	2,512	56.6	0.79
	Rough*	6	0.1	<0.01
	All serogroups	4,437	100.0	1.39

* When isolates are rough, the O group is not expressed and cannot be determined by phenotypic methods. These isolates can be O157 or non-O157.

Table 1b. Incidence rates of culture-confirmed human STEC O157 and non-O157 infections reported to LEDS by age group and sex, United States, 2014

Age group, years	O157 (n = 1,839)		Non-O157 (n = 2,396)	
	Female	Male	Female	Male
