

Morbidity and Mortality

Weekly Report

U. S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE
PUBLIC HEALTH SERVICE

Prepared by the COMMUNICABLE DISEASE CENTER 634-5131

For release November 1, 1963

ATLANTA, GEORGIA 30333

Vol. 12, No. 43

PROVISIONAL INFORMATION ON SELECTED NOTIFIABLE DISEASES IN THE UNITED STATES AND ON DEATHS IN SELECTED CITIES FOR WEEK ENDED OCTOBER 26, 1963

POLIOMYELITIS - Ten cases of poliomyelitis, all paralytic, were reported for the week ending October 26. Two cases each were reported from Connecticut, New Jersey, and Pennsylvania. Single cases were reported from Illinois, Wisconsin, South Carolina, and Florida.

The 10 cases bring the total thus far in 1963 to 352 cases (301 of which have been paralytic). This total figure remains well under one-half the number reported last year. Nineteen hundred and sixty-two represented the fewest cases of poliomyelitis ever recorded in the United States.

POLIOMYELITIS (CUMULATED WEEKLY) 1ST THROUGH 43RD WEEK

	1963	1962	1961	1960	1959
Paralytic	301	574	741	1932	4908
Total	352	724	1142	2798	7491

POLIOMYELITIS (SIX WEEK TOTALS) 38TH THROUGH 43RD WEEK

	1963	1962	1961	1960	1959
Paralytic	75	158	224	620	1453
Total	90	188	362	890	2017

EPIDEMIOLOGICAL REPORTS

Botulism - Canned Liver Paste - Canada and U.S.A.-

Three cases of type B botulism, including one death, all related to ingestion of a commercially canned liver paste, were reported from Montreal, Canada, for the week ending October 26. All victims had consumed Paragon label canned liver paste, processed by Delicious Food Products, Ltd., Montreal.

Shipments of this same product were made to the United States, to distributors in Elmhurst, New York, and Union, New Jersey. The New York shipment bore the Paragon label, while the New Jersey shipment carried the Epicure Club label. From these two distributors, shipments were made throughout the United States. The Food and Drug Administration and State and local health authorities have now accounted for most cans in commercial channels.

Table 1. CASES OF SPECIFIED NOTIFIABLE DISEASES: UNITED STATES
(Cumulative totals include revised and delayed reports through previous week)

Disease	43rd Week			Cumulative		
	Ended	Ended	Median 1958 - 1962	First 43 weeks		
	October 26, 1963	October 27, 1962		1963	1962	Median 1958 - 1962

Table 2. NOTIFIABLE DISEASES OF LOW FREQUENCY

Anthrax:	Cum.	4	Psittacosis:	Cum.	67
Botulism:	34	Rabies in Man:	1		
Malaria: Colo. - 1	83	Smallpox:	-		
Plague:	-	Typhus, murine:	24		

No cases of botulism, related to this product, have been reported in the United States, as of noon Wednesday, October 30.

In the Montreal outbreak, 2 of the cases were brothers, who made sandwiches from a can of the liver paste. The elder, a 17-year-old, consumed 3 sandwiches while his 16-year-old brother had but a few bites of another sandwich for supper on October 19.

The following day, the elder brother, who consumed the greater quantity, experienced numbness of his mouth, dizziness, diplopia, urinary retention, and weakness to the point that he was unable to walk. He retired for the evening and was found dead in bed the next morning, about 36 hours following the meal.

Early the morning of his brother's death, the younger victim began experiencing diarrhea, dizziness, and diplopia. He was immediately hospitalized and treated with bivalent antitoxin. He has since recovered uneventfully.

The can providing the liver paste for their sandwiches had been discarded and could not be located. However, *Clostridium botulinum* type B was demonstrated in remaining portions of the sandwiches.

Following Canadian publicity of the outbreak, it was learned that a 17-year-old male had been treated in Montreal with bivalent antitoxin September 2 for a case of diagnosed botulism. This patient had experienced headache, nausea, vomiting, dysphonia, diplopia and respiratory weakness. He was placed in a respirator. He recovered. The vehicle concerned was originally thought to be home preserved strawberry jam; subsequently, Paragon brand liver paste has been implicated.

In addition to the above cases, approximately 25 to 30 others were treated with antitoxin as suspect cases of botulism. They had consumed the same product and had experienced gastrointestinal, but no neurological, symptoms. These have not been officially reported as botulism cases.

No cases of botulism were reported from elsewhere in Canada.

The commercial product was removed from the shelves of the stores in the 6 provinces in which it was offered for sale: Newfoundland, New Brunswick, Nova Scotia, Prince Edward Island, Quebec, and Ontario. Laboratory tests on cans randomly selected from the shelves are in progress.

The processing plant is being investigated by Canadian Food and Drug officials. The plant has had no previous incidents of food poisoning and has allowed voluntary Canadian inspection annually for the past 2 decades.

The liver paste was made from pork liver.

(Reported by Dr. E.W.R. Best, Chief, Epidemiology Division, Department of National Health and Welfare, Ottawa,

Canada and the U.S. Food and Drug Administration.)

Editor's Note: The liver paste is the third botulism incident reported in North America this year to involve a commercially processed product. The first was the canned tuna fish (see MMWR, Vol. 12, p. 95) and the second was the smoked whitefish chubs (see MMWR, Vol. 12, pp. 329, 337 and 345).

Botulism - Smoked Fish Products - United States

The Food & Drug Administration, acting on the basis of its own findings and on the advice of a special advisory committee on botulism, has recommended the destruction of all products currently on the market which are made from Great Lakes fish or processed in establishments in the Great Lakes region. The FDA made two exceptions, with the provision that the criteria can be established with certainty: "(1) That the fish was heated immediately after it was packaged in a manner that would assure a temperature of at least 180°F. for at least 30 minutes in the coldest part of the fish. Such fish should be marked 'Perishable - Keep Under Refrigeration', or, (2) that the fish was frozen immediately after packaging and has since been maintained continuously in a frozen condition."

The FDA based its decision on the 3 known outbreaks of Type E botulism which have occurred during the past 3 years from fresh water fish obtained from the Great Lakes, (See MMWR, Vol. 12, pp. 329, 337, and 345), and on subsequent laboratory tests which it performed on such fish under special conditions.

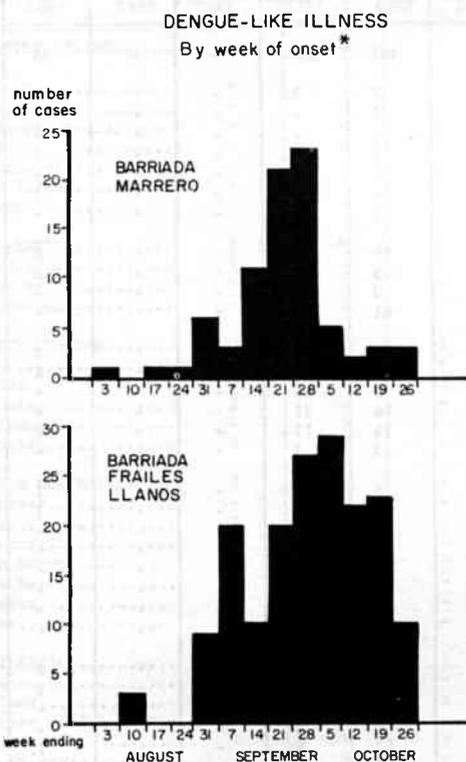

The FDA release stated further: "These outbreaks, including recent findings from the Tennessee and Michigan outbreaks, indicate that *Clostridium botulinum* type E spores are present in the incoming fish, the smoking establishments, or both. Bulk and packaged smoked fish packed by three Michigan firms, held deliberately by FDA laboratories without refrigeration for several days, showed evidence of type E botulinus toxin. . . .

"The organism is capable of germination, growth, and toxin formation at temperatures within the normal refrigeration zone, as low as 38°F., within 31-45 days in one case. Growth and toxin formation has not been reported at 36°F. and below for longer periods. Existing conditions for shipping and handling packaged and bulk smoked fish products do not insure against growth in toxin formation if the organism is present. Freezing of products immediately after processing, and maintaining in the frozen condition until delivered to the consumers, will prevent development of the toxin."

Dengue-Like Illness – Puerto Rico

During the past week, 543 cases of dengue-like illness were officially reported to the Puerto Rico Department of Health, bringing the 1963 total to 16,771 through October 28.

Intensive day-to-day surveillance continues in Barriada Frailes Llanos and Barriada Marrero in the township of Guaynabo. Attack rates in these population groups are as follows:

Period	Area	Population	Dengue-like Illness	Attack Rate(%)
August 1 – October 29	Guaynabo Township*	898	291	32.4
August 1 – October 23	Barriada Frailes Llanos	488	173	35.5
August 1 – October 23	Barriada Marrero	209	80	38.3

*From morbidity survey conducted on October 29.

The epidemic curves for Barriada Frailes Llanos and Barriada Marrero are shown (left). In one community the incidence of cases dropped abruptly following a peak during the week ending September 28, whereas new cases have continued to occur in the other area.

In addition, the total attack rate for females is significantly higher than the attack rate for males in Barriada Frailes Llanos; there is no significant difference in Barriada Marrero.

(Reported by Victor Gonzales, M.D., Director, Bureau of Health, Puerto Rico Department of Health, and a team from the Communicable Disease Center.)

(Continued on page 364)

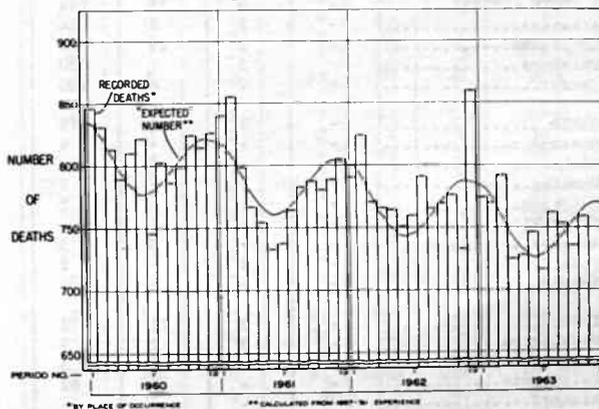

INFANT DEATHS IN 108 CITIES

The weekly average number of infant deaths in 108 cities for the four-week period ending October 26 was 759 as compared with an expected weekly average of 764.

TOTAL DEATHS UNDER ONE YEAR OF AGE IN 108 CITIES

	WEEK ENDING				4 Week Total	Weekly Average
	10/5	10/12	10/19	10/26

Bat Rabies – North Carolina

Since the first proved rabid bat was discovered in North Carolina in late July, 1963, approximately 100 residents of the State have been placed on an anti-rabies immunization regimen because of definite or probable exposure to bats. Most of the instances represent unprovoked attack by bats upon humans during the daytime hours.

In only 8 instances, however, have bats collected at the site of the attack been shown to be rabid by direct microscopic examination or by the fluorescent antibody technique.

The low incidence of proved bat rabies in the captured, peculiarly behaving bats suggests that another disease may be responsible in many cases. One possibility presently being considered is the effect of insecticides. Further investigation is in progress.

(Reported by Dr. Jacob Koomen, Assistant Secretary and State Health Director, North Carolina State Board of Health.)

Editor's Note: Since rabies virus is known to occur in salivary glands in animals without being present in their central nervous systems, it is imperative that all *bona fide* bat bites receive post exposure vaccine treatment unless the salivary glands, as well as brain tissues, are specifically examined and found to be negative.

INTERNATIONAL NOTES

One case of paralytic poliomyelitis was reported in Canada for the week ending October 19. This brings the Canadian total to 92 thus far in 1963.

This week's case was reported from Quebec, bringing that province's total to 85 so far in 1963.

For the comparable period in 1962, 52 cases of paralytic polio were reported from Quebec, whereas 87 cases were reported from the entire country. In 1961, for a comparable period, 99 cases of polio were reported in Quebec, and 165 cases throughout Canada.

(Reported in Weekly Report of Canadian Department of National Health and Welfare.)

In addition to the established procedures for reporting morbidity and mortality, the Communicable Disease Center welcomes accounts of interesting outbreaks or cases. Such accounts should be addressed to:
