<td>Bartholomew LK, Sockrider M, Abramson SL, et al.</td>
<td>Description: Evaluation of a multilevel school-based intervention to improve asthma self-management, medical care, and the school environment.</td>
<td>Treatment: N: 515 SES: Free or reduced lunch 66%. Ethnicity: African American 45% Hispanic 51% Caucasian 3% Other 1%. Control N: 431 SES: (Same as above). Ethnicity: (Same as above).</td>
<td>Study Design: Experimental, (RCT).</td>
<td><strong>Main Group Clinical Symptoms and Measurements:</strong> Symptoms declined significantly over time ($t_{691} = -3.31, P = .0016$), but there were no differences between treatment and control groups on symptom level or rate of decline.</td>
<td><strong>Main Group Absenteeism:</strong> Overall rates of absenteeism declined over the 3 years, but there were no differences by group in the frequency of absences over time. Overall rates of absenteeism declined over the 3 years of the study ($t_{58} = -2.40, P = .0195$).</td>
<td>Low participation rates—64% of parents returned case detection surveys and only half of those with probable asthma agreed to participate. Schools in study had 60%-80% rates of student turnover. Lack of available time for school nurses to contact physicians in an effort to change provider behavior.</td>
</tr>
</tbody>
</table>
have a report sent to their community provider. likelihood of being hospitalized over time, but for the enhanced intervention group, the rate of increase was slowing more rapidly.

Grades: Higher posttest grades for science (t_{175} = 2.31, P = .0213), language arts (t_{444} = 2.05, P = .0410), and social studies (t_{1174} = 2.50, P = .0127) and nearly so for reading (t_{443} = 1.68, P = .0936), but not for math.

Test Scores: Higher reading scores (t_{348} = 2.04, P = .0423) and writing scores (t_{15} = 2.77, P = .0143).

**Sending forms home with students (may have missed that day or may not have given to parents). Time constraints for parents and teachers for health team as well as for school nurses with high student loads. Caregiver motivation to take children to PCP. Some students in both groups also received OAS (independent of this study).**

**Description:** To test the efficacy of a preventive care network for children with asthma, including school nurses providing care coordination between PCP, families and school personnel, and training for PCPs and school personnel regarding asthma.

**Intervention N:** 30.7

**SES:** >50% FRL.

**Ethnicity:**
- African American 38%
- Caucasian 21%
- Hispanic 47%
- Other 42%.

**Control N:** 284

**SES:** >50% FRL.

**Ethnicity:**
- African American 34%
- Caucasian 21%
- Hispanic 48%
- Other 45%.

**Study Design:** Experimental, (RCT).

**Data Collection:** Telephone interviews with caregivers at baseline, 12, and 24 months. School records on absence data.

**Clinical Symptoms and Measurements:** Intervention had fewer days with symptoms that reduced activity in previous 6 months (9.5 fewer days, P < .05) and trend towards fewer symptoms (7.1 fewer days, P = .06).

**Medical Management:** No difference between groups in medications prescribed at follow-up.

**Utilization:** At 2 years, control group had fewer hospitalizations in past 12 months (P < .05).
| Bruzzone JM, Sheares BJ, Vincent EJ, et al. | Description: Randomized trial of the efficacy of Asthma Self-Management for Adolescents (AMSA) to evaluate asthma self-management, symptoms, frequency, quality of life, days of activity restriction and school absence. Setting: Urban, elementary school. | Intervention (AMSA) N: 175 SES: FRL 82% Ethnicity: African American 38% Hispanic 45% Mixed Race 10% Other 6%. Control N: 170 SES: FRL 82% Ethnicity: African American 36% Hispanic 46% Mixed Race 13% Other 4%. | Study Design: Experimental (RCT). Data Collection: Student questionnaires at baseline, 6, and 12 months. De-identified school attendance data for full sample by cohort, and identified data for those with parental permission. Clinical Symptoms and Measurements: Over the 12-month assessment period, relative to control subjects, AMSA students reported a 31% reduction in night awakenings because of asthma and a 42% reduction in the number of days with activity restriction because of asthma in the previous 2 weeks. This difference translates to a relative reduction of almost 21 night awakenings and 13 days with activity restriction per student over 1 year for the intervention group. There was no significant difference between groups in days with asthma symptoms over the year. Medical Management: At 6 months, odds of using controller medication twice as high in AMSA. Use of written plan was three times higher in AMSA. At 12 months, no Absenteeism: Both groups had reductions in self-reported absences over a 2-week period. Over 12-month period, 37% fewer self-reported absences in AMSA group or approximately 7 days saved per school year (P =.004). School de-identified records of absences for all reasons showed substantial increase at follow-up and with no significance between groups. AMSA students went from 26 to 42 days absent from year before intervention to follow-up year. Controls went from 24 to 35 days absent during the same time period. Grades: N/A Test scores: N/A | Absenteeism: Both groups had reductions in self-reported absences over a 2-week period. Over 12-month period, 37% fewer self-reported absences in AMSA group or approximately 7 days saved per school year (P =.004). School de-identified records of absences for all reasons showed substantial increase at follow-up and with no significance between groups. AMSA students went from 26 to 42 days absent from year before intervention to follow-up year. Controls went from 24 to 35 days absent during the same time period. Grades: N/A Test scores: N/A | Self-report bias for case detection, attendance, and possibly other outcome data. Limited extrapolation to other populations (e.g., suburban, white, or those with mild asthma). Possible nonspecific therapeutic factors. Possible mitigation by attention to treating asthma in controls through consent and survey process. Interim treatments that were unaccounted for, or contamination of controls by AMSA students. Study did not assess smoking status or secondary exposure. |
Effects of a comprehensive school-based asthma program on symptoms, parent management, grades and absenteeism.  

| Description | Intervention N: 416  
SES: Income <$15K yearly  
Medicaid: ND.  
Ethnicity: African American 98%.  
Control N: 419  
SES: Same as above.  
Study Design: Experimental (RCT).  
Data Collection: Telephone interviews with caregivers at baseline, 12 and 24 months. Official school records on grades. Data for all absences from school records.  
*Clinical Symptoms and Measurements:*  
At follow-up, treatment children with persistent disease had significant declines in both daytime (14% fewer, *P* < 0.0001) and nighttime (14% fewer, *P* < 0.0001) symptoms. Among children with both mild intermittent and persistent disease, those in the treatment | difference between groups in use of controller meds. AMSA four times likely to have written treatment plan.  
Utilization:  
Treatment did not affect the sure zero population (those individuals who will not use the urgent care of interest), but it did affect the use in non-sure zero AMSA students (those with a nonzero probability of using urgent care) relative to controls.  
Acute medical visits reduced by 28%. ED visits reduced by 49%. Hospitalizations reduced by 76% (yearly = 625. Medical visits, 681. ED visits, and 180 hospitalizations per 1,000 students). | Absenteeism:  
No differences in school absences for all causes between groups were noted in school records. Parents of treatment group children reported fewer absences attributable to asthma in the previous 3 months (34% fewer, *P* < 0.0001) and 12 months (8% fewer, *P* < 0.05).  
Grades:  
Official school records did not account for cause of absence. Perceptions or of students with asthma may have contributed to no difference in physical education grades. The program may have stimulated attention to symptoms at night by parents of children with mild intermittent disease.  

|  |
Absences among students with asthma in addition to their parents engaging in more asthma management activities.

**Setting:** Urban, elementary school.

**Ethnicity:** Same as above.

Data for absence due to asthma from parent interviews.

Group had 17% fewer daytime symptoms ($P < 0.0001$) but 40% more nighttime symptoms.

**Medical Management:** N/A

**Utilization:** N/A

Treatment children had higher grades for science ($P < 0.02$), but not reading, mathematics, or physical education.

**Test Scores:** N/A

### Description:
To determine the effects of two interventions—Open Airways for Schools (OAS) adapted for preteens, with and without Peer Asthma Action (PA2). This is a proven intervention for older adolescents, on the academic performance, self-regulation, quality of life and asthma symptoms of middle school children with asthma.

### Setting:
- **OAS**
  - N: 468
  - SES: Income < $15K: 48%.
  - Ethnicity: African American 90% Caucasian 1% Hispanic 2%.
- **OAS + PA2**
  - N: 416
  - SES: Income < $15K: 50%.
  - Ethnicity: African American 98% Caucasian 1% Hispanic 2%.
- **Control**
  - N: 408
  - SES: Income < $15K: 44%.
  - Ethnicity: Same as above.

### Data Collection:
- Student questionnaires.
- Official school records of academic grades.

### Clinical Symptoms and Measurements:
- **OAS:** No significant effect on symptoms or quality of life at 12 or 24 months ($OR = 1.1, P > 0.5$).
- **OAS + PA2:** No significant effect on symptoms or quality of life at 12 or 24 months ($OR = 1.3, P = 0.3$).

### Medical Management:
- N/A

### Utilization:
- N/A

### Grades:
- **OAS:** Mean positive change in GPA from 6th-8th grade vs. controls (mean change 0.09, $P = .02$) in the overall picture of decline for all students.

### Absenteeism:
- N/A

### Test scores:
- N/A

Clark NM, Shah S, Dodge JA, Thomas LJ, Andridge RR, Little RJ.

Schools faced severe economic cuts during the study period, distracting teachers, counselors, and families, and possibly affecting the potential of the interventions and dropout from study.
| Description: | Evaluate the impact of school based provision of inhaled corticosteroids vs. usual care in children with mild persistent to severe persistent asthma. | School-Based Care N: 89. | School-Based Care vs. Usual Care Clinical Symptoms and Measurements: No difference in symptom free days, symptom days, symptom nights between school-based care and usual care groups. When analyzed by months of follow-up, school-based care had increase in symptom free days in 2 weeks prior to interview during early winter months, Nov-Dec (9.2 vs. 7.3 days, \( P = 0.02 \)). | Absenteeism: School-based care group (n = 89) had decrease in absence because of asthma (6.8 vs. 8.8 days, \( P = 0.047 \)). Children without smoke exposure (n = 101) had decrease in absence due to asthma (4 vs. 7.6 days, \( P = 0.047 \)). Among children with smoke exposure (n = 79), no differences were found from intervention. |
| Setting: Urban, elementary school. | School-Based Care SES: FRL 87% Medicaid 76% CHIP 9%. Ethnicity: African American 57% Caucasian 12% Hispanic 33% Other 30%. | Study Design: Experimental (RCT). Post hoc analysis of effectiveness of intervention among children with (n = 79) and without (n = 101) secondhand smoke exposure in the home. Data Collection: Monthly telephone interviews with caregivers regarding variables during the school year. | Medical Management: No difference in days with rescue medication between school-based care and usual care groups. Utilization: No statistical difference in acute office visits, ED visits, or hospitalization for asthma between school-based care and usual care groups. | Parental reporting as sole source of data, no physiological measurements. Even the “usual care” group may have benefited from “enhanced awareness.” Sample consisted only of young, urban children. Possible under treatment of smoke- exposed children being kept on the same dose of medication during the school year. |

exposure. Among children with smoke exposure (n = 79), no differences were found from intervention.

Among children without smoke exposure (n = 101):

* **Clinical Symptoms and Measurements:**
  Increase in symptom-free days (11.5 vs. 10.5, \( P = 0.046 \)) in school-based care group.

* **Medical Management:**
  Decrease in days using rescue inhaler (1.6 vs. 2.3, \( P = 0.003 \)) in school-based care group.

* **Utilization:**
  Decrease in likelihood of having 3 or more acute office or ED visits for asthma (6 vs. 17 students, \( P = .03 \)).

**Randomized controlled trial to improve care for urban children with asthma: results of the School-Based Asthma Therapy trial.**

| Description: | Treatment N: 260. SES: Medicaid: 72% CHIP 12%. Ethnicity: African American 63% Caucasian 10% Hispanic 31% Other 27%. | Study Design: Experimental (RCT). | *Clinical Symptoms and Measurements:* During peak winter season, treatment group had more symptom-free days/2wks (11.6 vs 10.7) (\( P < .001 \)). Fewer nights with symptoms (2.3 vs. 1.7, \( P < .001 \)). Fewer days with activity limitation (1.3 vs. 1.8, \( P = .003 \)). | Absenteeism: Children in the treatment group experienced fewer days absent from school because of asthma than controls (0.3 vs 0.5 days/2 weeks (\( P = .002 \)).
| Grades: N/A |
| Test Scores: N/A |

Increased awareness by parents and PCPs likely caused some bias. Blinding was not possible and may account for some of the improvement in control group. Generalizability to urban population only—in contrast to author’s previous study. Intervention effects were independent of cotinine measures, and
| Halterman JS, Fagnano M, Montes G, et al. | **Description:** To test the feasibility of the school-based approach, by school nurses on asthma symptoms among urban children with persistent asthma. Replication study (original 2004 above) with larger sample, more stringent guidelines-based care with medication dose adjustments, ETS (environmental tobacco smoke) reduction program for children with smoke exposure. **Setting:** Urban, elementary school. | **Control**  
N: 263  
SES: Medicaid 74%  
CHIP 12%  
Ethnicity:  
African American 63%  
Caucasian 8%  
Hispanic 26%  
Other 29%  
track information. | **Medical Management:** Students in treatment group had less rescue medication use (1.6 vs. 2.6 days, P < .001), and were less likely to have prednisone prescribed for acute exacerbation (12% vs. 18%, P = .05). 100% of treatment group was using preventive medications by end of the study (vs. 60% of the control group).  
**Utilization:** Treatment group had lower, but no significant difference in visit rates for acute office visits, ED, and hospitalizations.  
Both groups demonstrated improvement over time during peak winter season, but by February, treatment group was experiencing a mean 1.2 additional symptom free days/2wks (95% CI 0.59 - 1.80).  
Improvements were seen in children exposed to smoke. | **Treatment**  
N: 48  
SES: Medicaid 69%

**Medical Management**: N/A

**Utilization**: N/A

**Absenteeism**: Post-Intervention Absenteeism (Total):

No differences between groups.

**Post-Intervention Absenteeism Due to Illness**:

On average, all students missed one less day of school due to illness in post-intervention period (4.9 vs 3.7 days, $P = .003$). Students with asthma in CM group had reduction from 5.8 days to 3.7 days (slightly over 2 days) compared with about 2/3 of a day in the control and nonresponsive groups. Grade and gender did not alter these findings, although younger children outcomes (e.g., more family support or better able to manage their illness).

School nurse had large caseload of students (2:300). Difficulty in reaching parents during the day. Multiple attempts to interact with PCP. Small groups limited generalizability. Difficult to determine effect of intervention with lengthy period to post-intervention measurement. Level of nursing and medical intervention not controlled for an evaluation of absence and academic performance.

**Utilization:**

**Longitudinal Population:**
- Increased specialist visits (44.8% vs 28.4%, P ≤ .01).
- Decreased admissions (14.9% vs. 3%, P ≤ .05).

**Cross-Sectional Population:**
- Increase in physician visits for asthma check-up, without asthma symptoms (39.5% vs. 19.9%, P ≤ .01).
- Increased physician visits for asthma symptoms (43.9% vs. 30.8%, P ≤ .01).
- Increased specialist visits (36.8% vs. 25%, P ≤ .01).
- Decreased admissions (1.8% vs. 9.6%, P ≤ .01).

**Oruwariye T, Webber MP, Ozuah P.**

Do school-based health centers provide adequate asthma care?

hospitalizations, ED visits, and school absenteeism.

**Setting:**
Urban, elementary school.

<table>
<thead>
<tr>
<th>Number of days student absent.</th>
<th>Nonsignificant trend towards increasing provider adherence. Documentation of tobacco exposure (OR 1.58, 95% CI 1.05-2.34).</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><em>Medical Management:</em> Among all children, 69% (92/133) were on appropriate medications. For children with persistent asthma, 55% were on appropriate medications (OR 0.43, 95% CI 0.19-0.96). Older children more likely to have written action plans (OR 2.3, 95% CI 1.0-4.9).</td>
</tr>
<tr>
<td></td>
<td><em>Utilization:</em> Specialist care: 16 children referred to pulmonologist, 3 kept appointment, 2 received appropriate meds. ED visits—use of peak flow meters associated with greater likelihood to have 1 or more ED visit in past year (OR 1.53, 95% CI 1.02-2.32) as well as seen a specialist (OR 3.65, 95% CI 1.05-12.6). Hospitalization: No statistically significant associations with 16.1 ± 12.2, P &lt; .002).</td>
</tr>

| Grades: N/A. | Test Scores: N/A. |

| Description: To examine whether a comprehensive model of a school-based asthma management program in a small rural school district helped improve asthma control. | Intervention: N: 299. SES: Medicaid 50%. Ethnicity: African American 40% Caucasian 55% Hispanic 4%. | Study Design: Mixed Methods—quasi-experimental/cross-sectional. Data Collection: Student questionnaires, spirometry and administrative records on age, sex, and race. | Clinical Symptoms and Measurements: Quasi-Experimental: Asthma Control Questionnaire (ACQ) scores (lower score = better control) lower in intervention students than in comparison (average score 0.21 points lower) \((P = .0085)\). Asthma control classification: 52% from intervention district well controlled vs. 40% of controls \((X^2 = 4.1479, P = .0417)\). Odds of being well-controlled was 55% higher in intervention group \((OR= 1.548, 95\% \text{ CI} 1.017-2.358)\). Cross-Sectional: Forced expiratory volume in one second \((\text{FEV}1)\). Among all students in asthma program, no significant difference in mean % predicted \(\text{FEV}1\) between baseline and follow-up. Among poorly controlled asthma students, there was a mean increase of 10.11 percentage points at follow-up \((P < .01)\). Among well-controlled asthma students, there was a mean decrease of 6.33 percentage points. | Absenteeism: N/A. Grades: N/A. Test Scores: N/A. | Flooding affected data collection in May 2011, with comparison district cancelling classes because of road closures; therefore, intervention district had data collection twice vs. once in comparison district. Response rate higher in intervention district. Existing asthma records had substantial amounts of missing data. 127 had records missing data; however, critical values regarding asthma control was not significant during analysis of "missingness." No baseline data from comparison site because of initiating evaluation with asthma program already underway. Did not measure "dosage" of individual program components or access to health care. No control for natural decline in asthma symptoms that may occur during childhood. |
at follow-up ($P < .01$).
No significant difference in Asthma Control Classification. Descriptive frequencies showed 44.3% of students moved from poorly to well-controlled classification. 17.5% of students moved from well to poorly controlled classification.

**Medical Management:**
N/A.

**Utilization:** N/A.

*Statistically significant at $P \leq 0.5$ level.
