

PUBLIC HEALTH REPORTS.

VOL. XXV.

SEPTEMBER 2, 1910.

No. 35.

SMALLPOX IN JAPAN.

By **FAIRFAX IRWIN**, Surgeon, United States Public Health and Marine-Hospital Service.

The existence of smallpox in Japan^a can be traced back as far as any written history goes, leaving its inception somewhat shrouded in mystery.

The first record is of an epidemic that occurred in August, A. D. 735. In 737 another epidemic occurred affecting all classes and of great mortality. This is said to have been the greatest epidemic known in Japan up to that time, and was followed by another in the summer and autumn of 738. These were the first recorded epidemics. In A. D. 790 there was an epidemic which was said only to have affected persons of 30 years of age or older, but the observation seems to be of doubtful authenticity. There followed an interval which appears to have been free from the disease.

Other epidemics then followed, which are recorded as follows: In 814; in March, 853; in 879; in August, 915, when the Emperor had the disease; in June, 947; August and September, 974; and July and August, 993; in the spring and summer of 1020; in 1036; and in June, 1072. In the year 1077 two of the royal princes, Atsukata and Atsubume, died of smallpox. Epidemics continued with great frequency, as follows: 1093; February-May, 1113; May, 1148; March, 1175, when the Emperor had the disease; December, 1192; April, 1209, 1277, 1311; and March, 1361. In 1374 the Emperor established a benevolent hospital for the treatment of the disease, the first hospital of its kind in Japan. Other epidemics took place in 1424, 1452, 1454, 1522, and 1550. In 1549 Xavier first came to Japan and gave medicine to the Japanese; the record does not state the character of the treatment, but there is no doubt that Xavier saw a great many cases. In 1543 the Portuguese came to Japan and settled on the Island of Kyushu.

Smallpox was certainly no novelty to them. In February, 1609, an epidemic is recorded in which the royal family suffered. About this time the Dutch came to Japan and trade was opened with Holland; they were allowed to live at Nagasaki and taught the medical science of those days to the Japanese. In 1798, the Government opened the first medical school (Igakukwan). The etiology of smallpox was first studied in this school under Prof. Ikeda Zuisen, a famous physician of the time.

^a Surgeon Irwin stated that according to official reports smallpox was not present in Japan July 27, 1910.

One of the legends relating to the first introduction of smallpox into Japan is as follows: In the sixth century the King of Korea sent images of Buddha to Japan and recommended that the Japanese adopt the Buddhist religion. About this time there was a great epidemic, probably smallpox, and it was attributed to the anger of the native gods at the attempt to introduce foreign gods and religion into the country. Possibly the disease may have been introduced at this time by the messengers of the Korean King. The Japanese might have well said: "Beware of the Greeks bearing gifts." In the spring and autumn of 1837 there was an epidemic. In June, 1849, a Dutch ship brought some vaccine virus to Japan and Doctor Monike vaccinated three children. Doctor Narabayashi Soken obtained some of this virus from Doctor Monike and was instructed in the art of vaccination. Severe epidemics occurred in 1870, 1876, and 1877.

In two of the ancient books of Japan (Daido Ruijuho and Zoku Kojidan) it is stated that smallpox was first brought into the Empire by fishermen returning from Korea. Official statistics of smallpox in Japan have been obtained from the department of home affairs for the following years (1898, 1899, 1900, 1904, 1905, 1906, 1907, and 1908) and are here given: In 1898 there were 149,012 cases and 40,971 deaths, giving a death rate of 27.47. In 1899 there were 14,890 cases and 4,089 deaths. In 1900 there were 3,608 cases and 721 deaths. In 1904, 1,188 cases were recorded, with 237 deaths. Let it be observed that the death rate had now fallen from 27.47 in 1898 to 19.95 in 1904. In 1905 there were 10,704 cases and 3,388 deaths. We have here a decided increase in the number of cases and deaths and a rise in the death rate to 31.61 per hundred cases. It is stated that while smallpox is not a rare disease in Japan it is not permanent. It is always imported from abroad, and the infection seems to come chiefly from Korea, Manchuria, and Siberia. During 1906 there were 496 cases, of which 109 proved fatal, the death rate falling to 21.98. The total number of cases of smallpox which occurred during the year 1907 was 1,034, of which 437 were fatal, and in 1908 there were 18,075 cases and 5,838 deaths.

It is to be expected that the death rate should differ accordingly as vaccination is carried out, but unfortunately statistical investigations of this kind are not yet available. The death rate in 1907 in general was 42.26 per cent and 32.30 per cent in 1908. Whether such high death rates are to be ascribed to the fact that the smallpox which prevailed in these two years was especially malignant or whether light cases were not reported or again whether the number of unvaccinated increased can not now be answered.

VACCINATION.

PRESENT LAW OF VACCINATION.

1. Mayors of cities and heads of villages fix the time for vaccination every year from March until June.

Children 1 year old born the previous year must be vaccinated.

2. Children having reached the age of 10 years must be vaccinated.

3. Those who were vaccinated the previous year, but unsuccessfully, must be vaccinated again.

If necessary, officials may decide to vaccinate at any time.

4. The sanitary officials may decide the place of vaccination.

5. The guardians of the children having smallpox must obey the regulations.

6. The officials may vaccinate at different times and places all inhabitants of houses where an infectious disease has appeared.

7. If for any reason the day for vaccination is postponed, the vaccination must be made within 30 days.

8. A search must be made for any person attempting to evade vaccination and the operation performed.

9. Inspection is to be made 6 or 7 days after vaccination.

10. A certificate for vaccination is given after the operation is performed.

11. There are three kinds of reports made to the mayor at the office of the Honseki, or in the official report at the original place of birth:

(a) The date on which the first vaccination was performed.

(b) The date of operation if not successful, second vaccination.

(c) Whether the subject had smallpox.

12. The mayor must make a report to the place where the person concerned is at present living.

13. Certificate from the physician must be secured.

14. When vaccination is unnecessary:

(a) Persons who have had smallpox and have certificate to that effect.

(b) Persons who have been certified for the postponement of vaccination.

(c) Kindergarten and other schools where the vaccination has been performed under other supervision.

(d) Those who have a certificate of vaccination.

(e) Those who have a certificate from the mayor.

(f) Those who have marks of smallpox and of recent vaccination.

15. The governor may temporarily decide on the time of vaccination by permission of the home minister.

From Meiji 42 year (1909).

The total number of persons who were regularly vaccinated during the year 1908 was 9,398,135, which is 18.26 per cent of the entire population. These figures are taken from the report of the central sanitary bureau, which adds the following comment:

This percentage is almost three times as large as that in ordinary years. Such great increase is probably due to the fact that during this year smallpox prevailed, and consequently vaccination was strictly enforced in various localities. However, the fact that the number of persons responsible (sic) to be vaccinated remarkably increased, especially during this year, can not but demonstrate the imperfection of the administration concerning vaccination.

Of the number vaccinated 1,876,633 were vaccinated for the first time and 7,491,084 for the second and third times.

RESULTS OF VACCINATIONS.

Of the total number of persons regularly vaccinated during 1907, 1,274,320 were successful and 172,838 were unsuccessful in first vaccination; 344,162 successful and 645,982 unsuccessful in second vaccination; and 225,471 successful and 636,323 unsuccessful in third; that is to say, the proportion of successful cases to the total number of vaccinations was 88.06 per cent in first vaccination, 34.76 per cent in second vaccination, and 25.59 per cent in third vaccination.

Of the total number vaccinated during 1908, 1,556,263 were successful and 320,395 were unsuccessful in first vaccination; 1,244,555 successful and 1,535,309 unsuccessful in second vaccination, and 1,661,596 successful and 3,052,651 unsuccessful in third vaccination.

Thus the proportion of successful cases to the total number of vaccinations was 82.93 per cent in first vaccination, the lowest ratio since 1899, while 44.77 per cent in second vaccination and 35.25 per cent in third vaccination are high ratios. The real cause for such sudden rise of the ratio in second and third vaccinations is not positively known, but it seems to be due to the fact that many persons who had neglected vaccination in previous years were now forced to submit owing to a more vigorous enforcement of the laws. Appended is a table showing the number of persons vaccinated in the decade 1890-1899.

Number of persons vaccinated in each of the last ten years.

FIRST VACCINATION.

Year.	Successful.	Unsuccessful.	Total.	Successful per 100.

UNITED STATES.

REPORTS TO THE SURGEON-GENERAL, PUBLIC HEALTH AND MARINE-HOSPITAL SERVICE.

PLAGUE-PREVENTION WORK.

Passed Assistant Surgeon McCoy reports:

INFECTED GROUND SQUIRREL.

A plague-infected ground squirrel was found August 9, 1910, at Cragmont, Alameda County, Cal.

The finding of this squirrel is of more than ordinary interest, as the animal came from that part of Alameda County in which measures have been carried on for the creating of a squirrel-free zone around the cities of Berkeley and Oakland. The squirrel was found in approximately the same locality that furnished a number of infected squirrels during the early months of the current calendar year.

A few days ago it was found after a thorough examination that some squirrels had migrated into this zone and measures were taken to exterminate them. On the first day of the work this infected squirrel was found. Whether this squirrel is one of the few that probably escaped the squirrel exterminative measures that were carried on in this vicinity some months ago or whether it represents immigration from the outside can not be determined. Vigorous measures are being taken to completely exterminate this focus.

ANIMALS EXAMINED FOR PLAGUE INFECTION.

During the week ended August 13, 1910, there were examined for plague infection at the federal laboratory at San Francisco and the branch laboratories at Oakland and Los Angeles, Cal., animals as follows: Squirrels 3,084, gophers 6, rabbits 22, weasels 2, rats 2,228. The rats were identified as follows: *Mus norvegicus* 1,828, *Mus rattus* 56, *Mus musculus* 272, *Mus alexandrinus* 72.

The total number of animals examined was 5,342. One plague-infected squirrel was found.

DISTRIBUTION OF POISON.

In connection with the making of a squirrel-free zone around the cities on San Francisco Bay, 650 acres of land in Alameda County were covered with poison during the week ended August 13, 1910.

SEATTLE, WASH.

Assistant Surgeon Chapin reports:

During the week ended August 13, 1910, 1,058 rats were collected. Of these, 961 were necropsied and examined for plague infection. No plague rats were found.

Record of Plague Infection.

Place.	Date of last case of human plague.	Date of last case of rodent plague.	Total number of rodents found infected since May, 1907.
California:			
Cities—			
San Francisco	Jan. 30, 1908	Oct. 23, 1908	398 rats.

SPECIAL RULES ADOPTED BY THE IOWA STATE BOARD OF HEALTH REGARDING INFANTILE PARALYSIS.

The Iowa state board of health adopted the following special rules regarding poliomyelitis at a meeting held August 17, 1910:

All cases of infantile paralysis, or suspected cases, shall be reported by the attending physician or the head of the family to the local board of health.

The state board of health recommends the quarantine of all cases for at least two weeks after the beginning of the disease and thorough disinfection of infected premises after the termination of the disease.

It is a well-established fact that the infectious material is found in the secretions of the nose and mouth of afflicted persons, and the board therefore recommends the use of sprays or gargles of 1 per cent² solution of hydrogen peroxide to prevent the further spread of the disease. All discharges from the patient should be disinfected by means of bichloride of mercury or carbolic acid.

IOWA—*Dubuque*.—Month of June, 1910. Population 47,585. Total number of deaths from all causes, 50, including diphtheria 1, tuberculosis 3. Cases reported: Diphtheria 5, scarlet fever 8.

KANSAS.—Month of May, 1910. Population 1,703,002. Deaths from contagious diseases: Typhoid fever, 11, smallpox 1, measles 25,

scarlet fever 10, diphtheria 7, tuberculosis 65. Cases reported: Typhoid fever 31, smallpox 304, measles 1,488, scarlet fever 181, diphtheria 68, tuberculosis 258.

MICHIGAN.—Month of May, 1910. Population 2,666,308. Total number of deaths from all causes, 3,105, including typhoid fever 28, smallpox 11, measles 56, scarlet fever 37, diphtheria 28, tuberculosis 244. Cases reported: Typhoid fever 66 in 42 localities, smallpox 372 in 91 localities, measles 1,539 in 169 localities, scarlet fever 617 in 107 localities, tuberculosis 184.

MINNESOTA.—Month of March, 1910. Population, 1,979,658. Total number of deaths from all causes 1,787, including typhoid fever 41, measles 56, scarlet fever 31, diphtheria 42, tuberculosis 320.

NEW JERSEY.—Month ended July 10, 1910. Population, 1,883,669. Total number of deaths from all causes 3,117, including typhoid fever 37, measles 18, scarlet fever 19, diphtheria 34, tuberculosis 359.

NORTH DAKOTA.—Month of June, 1910. Population, 536,103. Total number of deaths from all causes 366, including scarlet fever 1, diphtheria 2, tuberculosis 1. Cases reported: Typhoid fever 4, smallpox 20, measles 99, scarlet fever 42, diphtheria 37, tuberculosis 5.

WISCONSIN.—Months of January, February, and March, 1910. Population, 2,388,356. Deaths from contagious diseases include typhoid fever 68, measles 7, scarlet fever 67, diphtheria 50, tuberculosis, pulmonary, 187. Cases reported: Typhoid fever 644, smallpox 197, measles 944, scarlet fever 1,856, diphtheria 564, tuberculosis, pulmonary, 358.

FOREIGN AND INSULAR.

GERMANY.

Inspection of Russian Emigrants—Precautions Observed at Bremen.

Consul Fee at Bremen reports, July 20:

Upon arrival on the German frontier the tickets of Russian emigrants will be marked with a stamp, indicating the time of actual departure from Russia. From there the Russian emigrants are conveyed in special trains to the port of embarkation. Upon arrival at Bremen they have to pass a medical inspection, and they are then lodged in boarding houses which are especially reserved for them. Here they are under constant control of the Bremen health office.

On the sixth day after crossing the frontier the Russian emigrants are again subjected to a close medical inspection and then allowed to proceed on their journey.

The disinfection of the baggage of the Russian emigrants takes place at the control station at the German frontier. The disinfected baggage is marked with a stamp, and this we accept here as sufficient.

Emigration is watched very carefully at this port, both by the local authorities and by this office, and every precaution is taken to facilitate the detection and to prevent the spread of contagious diseases. No case of cholera has been reported here.

Cholera at Spandau.

The following information was received from the Department of State August 29:

The consul-general at Berlin wires: Two cases of cholera at Spandau, near Berlin, with 1 death. Both were Germans residing there. Contacts isolated in cholera barracks. All measures being taken.

HAWAII.

Last case of human plague at Honolulu occurred July 12, 1910.

The last plague-infected rat was found at Aiea, 9 miles from Honolulu, April 12, 1910.

At Hilo the last case of human plague occurred March 23, 1910.

The last plague-infected rat was found at Piihuona, 4 miles from Hilo, April 9, 1910.

Passed Assistant Surgeon Ramus reports, August 8:

HONOLULU—Plague-prevention Work.*Week ended August 6, 1910.*

Total rats and mongoose taken	784
Trapped	782
Found dead (<i>mus musculus</i> 1) (<i>mus norvegicus</i> 1).....	2
Examined bacteriologically	698
Plague rats	0
Classification of animals trapped:	
<i>Mus alexandrinus</i>	80
<i>Mus musculus</i>	332
<i>Mus norvegicus</i>	106
<i>Mus rattus</i>	239
Mongoose	24
Average number of traps set daily.....	1, 738

INDIA.**CALCUTTA—Cholera and Plague.**

Acting Assistant Surgeon Allan reports, July 27:

Week ended July 9. At Calcutta there were 11 deaths from cholera and 22 from plague; in all Bengal, 43 cases of plague, with 68 deaths reported (including 31 which occurred during the week ended July 2); in all India, 801 cases of plague, with 717 deaths.

MEXICO.**Report from the Superior Board of Health of Mexico.**

In compliance with articles 1 and 2 of the International Sanitary Convention held at Washington October 9-14, 1905, the president of the Superior Board of Health of Mexico reports, August 8 and 15, that no case of yellow fever and no death from the said disease were registered in the Mexican Republic during the weeks ended August 6 and 13, and that the prophylactic measures reported under date of September 28, 1908, continue to be carried out.

Yellow Fever at Merida.

Acting Assistant Surgeon Harrison at Progreso reports, August 26: One death from yellow fever at Merida, August 26.

PHILIPPINE ISLANDS.**MANILA—Cholera.**

Chief Quarantine Officer Heiser reports, July 15:

Week ended July 9. In the city of Manila 20 cases of cholera, with 15 deaths, were reported.

Cholera in the provinces.

Province.	Cases.	Deaths.
Batangas.....	5	1

RUSSIA.**Status of Cholera—Examination of Emigrants.**

Acting Assistant Surgeon De Forest at Libau reports, August 7:

During the week ended August 7 there were 472 cases of cholera, with 159 deaths, reported in the city and suburbs of St. Petersburg, leaving at the close of the week 701 cases present in city and suburbs. There were reported 412 cases of suspect cholera, with 44 deaths. These cases presented every symptom of cholera, but were not bacteriologically verified. For all Russia, exclusive of St. Petersburg, there were reported for the week ended August 5 11,342 cases of cholera, with 5,061 deaths.

During the week ended July 31, 3 cases of smallpox were reported at Libau. At the close of the week there were 14 cases of smallpox present. The steamship *Lituania* sailed from Libau for New York August 2 with 834 steerage passengers. All had been in Libau for 5 full days under observation.

Plague in the Province of Astrakhan.

Chargé d'Affaires Wheeler, at St. Petersburg, reported July 21 to the Department of State:

Thirteen cases of bubonic plague with 12 deaths were reported from June 26 to July 7 in the Narinsk and Kalmuk districts of the Kirghiz Steepe, province of Astrakhan. They occurred in 4 camps. The cases have been bacteriologically verified.

A government commission has been sent to the locality in which the outbreak occurred and all measures have been taken to localize and control the epidemic. Contacts have been isolated.

ODESSA—Cholera and Plague.

Consul Grout reports, August 1:

During the week ended July 29 there were reported 102 cases of cholera, with 47 deaths. At the close of the week there were 101 cases of cholera remaining in hospital. From the beginning of the outbreak to July 29 a total of 316 cases, with 158 deaths, has been reported.

Four cases of plague were reported from July 25 to 31, occurring as follows: On July 25 and 30, 1 case each, and on July 31, 2 cases. All premises from which cases were taken have been disinfected. The case reported on July 30 occurred on the same premises on which the first case occurred.^a

VENEZUELA.**LA GUAIRA—Inspection of Vessels.**

Acting Assistant Surgeon Kellogg reports, July 17 and 24: During the week ended July 16, 4 vessels having 320 in crews and 157 passengers, and during the week ended July 24, 4 vessels, crews 383, passengers 332, were inspected. No quarantinable diseases were reported in La Guaira or vicinity.

^a Public Health Reports, August 12, 1910, p. 1126.

CHOLERA, YELLOW FEVER, PLAGUE, AND SMALLPOX.

Reports Received During Week Ended September 2, 1910.

[These tables include cases and deaths recorded in reports received by the Surgeon-General, Public Health and Marine-Hospital Service, from American consuls through the Department of State and from other sources.]
