

# PUBLIC HEALTH REPORTS

VOL. 33

JUNE 28, 1918

No. 26

## VACCINATION AGAINST SMALLPOX AND TYPHOID FEVER.

TREASURY DEPARTMENT,  
OFFICE OF THE SECRETARY,  
*Washington, June 4, 1918.*

*To persons in charge of establishments manufacturing war materials:*

From the standpoint of health conservation and labor efficiency, it is imperative that such communicable diseases as smallpox and typhoid fever be prevented in all establishments manufacturing materials for the Federal Government. This is of special importance at the present time in view of the constant movement of labor from one locality to another, which facilitates so greatly the spread of disease.

The experience of every civilized country shows that complete protection is furnished against smallpox by vaccination, and temporary immunity against typhoid by inoculation with typhoid vaccine.

In order to prevent such diseases, upon the recommendation of the Surgeon General of the United States Public Health Service, persons in charge of plants engaged in the manufacture of war materials are urged to require every person employed under them to be vaccinated against smallpox and inoculated against typhoid fever, as now done in the case of our military forces.

The medical staff should be instructed to take the necessary steps for the enforcement of these measures. The need for them has already been demonstrated by the occurrence of isolated outbreaks of smallpox in establishments engaged in the production of war materials through imported labor. These outbreaks not only cause the quarantine of the personnel, but also interfere seriously with the production of materials necessary to the conduct of the war.

The Public Health Service is ready to cooperate in enforcing these measures, and any persons calling at any of the service stations will, on request, be vaccinated against smallpox or typhoid fever free of cost.

J. H. MOYLE,  
*Acting Secretary.*

## DRIED MILK POWDER.

### A REVIEW OF BRITISH EXPERIENCE.

The local Government board of Great Britain has recently issued a series of reports under the general classification "Food Reports No. 24" upon the preparation, composition, and nutritive values of dried milk powders, with special reference to their use in infant feeding. It is stated that this article is coming into rather large use in the preparation of certain foodstuffs and in the feeding of infants. In view of these facts and of certain claims which have been made as to the advantages of this product over ordinary cow's milk, especially from the point of view of freedom from bacteria of a dangerous sort, a somewhat extensive inquiry into the entire subject has been deemed advisable.

#### History, Manufacture, and Uses.

The first branch of this inquiry related to the use of dried milk in infant feeding and was carried out by Dr. F. J. H. Coutts with the assistance of Prof. Delépine. A brief history of dried milk and of its methods of preparation is first given. It is stated that as early as 1868 "desiccated milk" was an article of commerce. Since that time, and especially during the past 20 years, considerable advance has been made in the methods of preparation, the general purpose being to secure a dry residue by evaporation at the lowest possible temperature and in the shortest time. Most of the processes employed use one or another form of revolving heated drum, upon the surface of which a thin milk layer is spread and from which the dried product is scraped. The most recent processes inject a stream of partially condensed milk into a heated chamber in the form of a fine spray, the evaporation taking place in the air and the dry powder falling to the floor. In the factories the conditions of manufacture, as regards general cleanliness, were found to be excellent. The author, however, does not agree with the commonly expressed view of the desirability of small-scale manufacture upon the farm. He found in many such cases that the most elementary precautions as to cleanliness were being neglected. The importance of placing this industry under the supervision and control of public health officials is emphasized. About 5,000,000 pounds of milk powder were imported into England during 1915 of which one-half came from the United States, and the importance of some form of guarantee as to the conditions of manufacture of imported products is also noted.

The market product is of three main varieties, namely, full-cream, half cream, and skimmed. Certain firms, however, make other

preparations, including some with additional cream. Certain preparations also contain added cane sugar.

Dried milk is used as a basis of certain proprietary infant foods. It is also employed in admixture with cocoa and sugar, with egg powder and sugar as a custard powder, and in various other combinations. Dried milk is said to be used extensively in many of the industries, particularly in the baking and confectionery trades. Reference is also made to a so-called synthetic dried milk made entirely from vegetable materials. The use of the word milk in this connection is considered rather unfortunate. The ethics of labeling and advertisement are discussed, and the investigations showed on the whole a reasonable regard to accuracy, although in some instances advertisements were decidedly objectionable.

#### Physical and Chemical Characteristics.

The literature on the physical and chemical characteristics of milk powders is quoted at length. Dr. Monier-Williams reported in 1909 upon a sample of whole milk powder, dried upon a drum at  $100^{\circ}+$ , C. Upon mixing with a small amount of water, stirring until homogeneous, and then adding cold, previously boiled, distilled water to make a 12.5 per cent solution, a product was obtained which did not have the homogeneous appearance of fresh milk. It had a slight smell of boiled milk and the fat separated quickly as a yellow layer at the surface. The curd produced by rennet was flocculent and finely divided; that produced by acetic acid was similar to that produced from normal milk. The reconstituted milk did not contain the active enzymes of fresh milk as shown by the peroxydase reaction. The fat globules viewed under the microscope were in most cases larger than those in fresh milk and there was observed a considerable amount of undissolved proteid. A considerable proportion of the lactalbumen had been converted into a form insoluble in magnesium sulphate. The milk sugar had undergone no alteration. A somewhat extensive compilation of various analyses of milk powders is given. Among the foreign substances found are cane sugar, bicarbonate of soda, various preservatives, coloring matter, starch, foreign fat, dirt, and traces of certain metals.

#### Bacteriology.

A similar comprehensive review of the literature of the bacteriology of dried milk is given. In view of the small amount of information available, a further investigation was made by the author and 42 samples of commercial preparations were submitted to the Lister Institute. Ten per cent solutions of the powder showed aerobic bacteria growing at  $22^{\circ}$  C., ranging in numbers from 100 to 757,000 per cc. and at  $37^{\circ}$  C., from 100 to 892,000 per cc. The results for the most part, however, ranged under 10,000 per cc. in each case. The

presence of streptococci, enteriditis, and *B. coli* was recorded in many of the samples. There was no evidence of tuberculosis in guinea pigs inoculated from these samples.

Investigations made at the factory indicated an enormous reduction in bacteria during the process of drying and a subsequent recontamination during handling and packing. The experiment was tried of running through the drying process a specimen of milk from a tubercular cow and one heavily inoculated with a potato culture of tubercle bacilli. Subsequent inoculations of guinea pigs indicated that living tubercle bacilli may survive the process of manufacture of dried milk, but "the course of the disease produced by the bacteria was very much slower than that of the disease produced in guinea pigs inoculated with the same amount of untreated tubercular milk." No evidence of tubercular infection was obtained by feeding experiments upon four young rabbits.

#### Infant Feeding.

Upon the basis of a review of the experience of many authorities and of information obtained by personal visits to several large infant feedings stations, the opinion is expressed that when breast feeding is impossible dried milk is a very valuable food for infant feeding. This statement applies, however, only to milk of recent manufacture, made from a good quality of cow's milk under hygienic conditions. It is probably no better than and perhaps slightly inferior to fresh cow's milk, but under the present conditions in cities, and especially in hot weather, it is often desirable to use it in preference to the latter, and this can be safely done without fear of prejudicing the health and progress of the infant. Many infants suffering from digestive troubles show excellent progress on dried milk. Scurvy and rickets are rare in infants fed on this preparation, although the occasional use of fruit juice is desirable.

Increasingly large quantities of milk powder are being used in maternity and child welfare stations supported by public health authorities and voluntary agencies in England and Wales. A list is given of some 75 districts, including some of the principal cities of Great Britain, in which this is the case. At Leicester a dried-milk depot is open every day and consultations are held twice each week. The milk powder is supplied in packages with directions and in three grades, namely, full cream, three-quarters cream, and half cream. The very poor obtain this material at less than cost or even free, while the average purchaser pays a slight margin of profit. Similar details of the operation of some of the other large welfare stations are given.

For administrative purposes, under the "Sale of food and drugs act," milk powders are classed with condensed milk. An extensive bibliography closes the section.

### Nutritive Value.

This section is a report of the investigation conducted by George Winfield, M. A., on behalf of the medical research committee. The conclusions are based in part upon observations at infant welfare centers in Leeds and Sheffield and in part on animal feeding experiments. The growth curves of children fed exclusively upon dried milk from birth closely resemble the average growth curve of breast-fed children, although at somewhat lower levels by reason of the more delicate condition of these children. The conclusion is reached "that cow's milk, during the process of desiccation, loses none of the characters which are necessary for the support of normal growth in infants." Teething and walking begin at normal ages, and there is no greater liability of rickets and scurvy. The experiments on rats led to the conclusion that dried milk as a sole food maintains an animal in good health and permits normal growth for periods which long outlast those corresponding with infancy and early childhood in the human subject.

### Examination of Milk Powders.

This section of the report, prepared by Sir James Dobbie, Government chemist, presents in detail the methods of chemical examination employed and the analytical results obtained upon a large number of commercial samples of all sorts. These results are summarized in Dr. Coutts's report.

---

## STATE AND FEDERAL COOPERATION IN COMBATING THE VENEREAL DISEASES.

By J. G. WILSON, Passed Assistant Surgeon, United States Public Health Service.

In the Public Health Reports for May 24 an article entitled, "Progress in Venereal Disease Control," showed that the States were rapidly adopting regulations which made these infections notifiable and placed them on much the same footing as other communicable diseases.

Since this article was written further progress has been made. Of the 48 States, 37 now have laws which require notification of the venereal diseases. Most of these States have adopted regulations modeled after suggestions approved by the Surgeons General of the Army, the Navy, and the Public Health Service.<sup>1</sup>

Following is a list of 24 States in which definite arrangements have been made to cooperate with the Federal Government by having an officer of the Public Health Service assume charge of venereal

---

<sup>1</sup> Suggestions for State Board of Health Regulations for the Prevention of Venereal Diseases, approved by the Surgeon General of the Army, the Surgeon General of the Navy, and the Surgeon General of the Public Health Service, Reprint No. 459 from the Public Health Reports, Mar. 29, 1918.

disease control under the joint supervision of the State health department and the United States Public Health Service:

Alabama.	Kentucky.	Montana.
Arizona.	Louisiana.	New Hampshire.
Arkansas.	Maine.	Ohio.
Colorado.	Massachusetts.	Oregon.
Florida.	Minnesota.	Rhode Island.
Georgia.	Mississippi.	South Carolina.
Indiana.	Missouri.	Virginia.
Iowa.	Maryland.	Washington.

In addition to the foregoing, arrangements are being perfected as rapidly as possible with 12 other States whose health officers have expressed a desire to cooperate in the same way.

In most of the 24 States where arrangements have been made for State and Federal cooperation the work is well under way, and in many of them very definite results have already been accomplished. In practically all of these States regulations have been passed which provide ample legal authority for dealing with the problem according to the plan approved by the Surgeons General of the Army, the Navy, and the United States Public Health Service. Consequently the work of the medical officer in charge of venereal-disease control is largely directed toward the organization of the State to carry out the program already agreed upon. The campaign for this organization naturally follows four principal channels, to wit:

(1) Educational: Acquainting the public with the nature of the diseases and the objects desired to be accomplished.

(2) Law enforcement: Securing cooperation of the physicians in reporting cases, and of the police in apprehending prostitutes, vagrants, and such other persons as can be reasonably suspected of having venereal disease in communicable stages.

(3) Propaganda to secure local funds for providing detention homes and hospital facilities for isolation and treatment of venereal-disease carriers who by their habits are a menace to the public health.

(4) Establishment of increased facilities for early diagnosis and treatment.

The following report of progress by Scientific Assistant L.W. Feezer, chief of division of venereal diseases, Minnesota, is a good example of what can be accomplished in a short time by well-directed efforts along the foregoing lines:

ST. PAUL, MINN., June 11, 1918. •

SURGEON GENERAL,

*United States Public Health Service, Washington, D. C.*

SIR: The following is submitted as a summary of the activities of the Minnesota State Board of Health in connection with the control of venereal diseases during the month of May, 1918:

### Reporting of Cases.

A few scattered reports of cases of gonorrhea and syphilis have been voluntarily made by physicians. The official reporting card to be used for making such reports has not yet been received from the printers, and it is not the intention to require such reports until the necessary forms can be supplied. The report card will constitute the back cover of a pamphlet of information and instructions which the physician is required to give the patient at the time he first comes for treatment.

A survey was made of the prisoners in the Minneapolis city workhouse on Sunday, May 26. The survey consisted of the examination of 187 prisoners, 42 women and 145 men, for the detection of venereal disease. The examinations were made with the assistance of a number of internes and nurses from the State University Hospital and was done under the supervision of Dr. H. G. Irvine, director of the division of venereal diseases. A Wassermann was taken in each case. Smears were made from all women and from men who showed a discharge. The results were as follows:

	Wassermann's positive.	Active gonorrhea.
Males.....	50	7
Females.....	19	14

### Treatment.

The city workhouse of Minneapolis has made arrangements for treatment of venereal cases in its custody. A physician has already been employed, who will give half of his time to this work, and facilities are being provided for the treatment of a considerable number of cases at one time in the workhouse buildings. Particularly in the case of women prisoners is it necessary to have proper facilities.

The city of St. Paul, through the department of public safety, has likewise undertaken to provide the necessary equipment and personnel for treating city prisoners, especially those held for offenses involving prostitution. The city architect has prepared the plans for a treatment room in accordance with suggestions from the State Board of Health. The University Hospital has agreed to place at the disposal of the syphilis clinic 12 beds for the treatment of cases requiring hospital care.

### Distribution of Arsphenamine.

In accordance with the plans for supplying free arsphenamine to competent physicians for the treatment of indigent syphilitics in the infectious stage of the disease and to dispensaries and hospitals complying with certain standards for similar use, arsphenamine has been supplied to the University Hospital Dispensary, the Minneapolis City Workhouse physician, and the St. Paul City and County Hospital, in all 170 ampules.

### Educational Work.

Twenty-five thousand pamphlets have been procured and are being distributed to all applicants. Several hundred signs have been posted in public toilets and 3,000 more are in preparation.

Two courses of lectures have been held at the State university, one for juniors and seniors and one for graduate students. Five courses of 10 lectures each have been introduced into each of the 5 State normal schools. These have reached 2,000 students, all of whom will become teachers within a year. Courses of lectures by two members of the staff of the division have been arranged for the university summer school to begin in June. Circular letters have been sent to the Women's Council of National Defense in each county and to the Parents and Teachers Associations in the Twin

Cities. Five lectures have been given in the Minneapolis City Hospital to student nurses, and an educational motion-picture film has been shown to teachers in St. Paul and Minneapolis.

A series of six articles explaining the State and Federal campaign for control of venereal diseases is now in process of publication in one of the city papers, and a Duluth paper has asked for a similar series.

Members of the divisional staff have addressed the 3 county medical societies, 2 rotary clubs and approximately 25 women's clubs.

#### **Law Enforcement.**

As a result of a conference between officers of this department, municipal judges and police authorities, the municipal courts of the Twin Cities have agreed to hold persons arrested for offenses involving prostitution, without the option of bail, for medical examination, and the imposition of workhouse sentences without the option of fine has been made the routine punishment for all such cases.

Reports from military authorities of sources of infection of soldiers have been reported to police authorities, and in some cases have led to arrest and sentence. A number of persons so arrested are now under treatment.

Through the social service agencies of this division, prostitutes reported as having infected soldiers have been located and in certain instances examinations have been made and treatment instituted. The social worker and protective officer have investigated the matter of soliciting and prostitution in parks and regions adjoining the military training places and other amusement places.

#### **Summary.**

Summarized, the innovations made by the city authorities in the Twin Cities as a result of the activities of this board are as follows:

Minneapolis: Three men added to the park police force, employment of workhouse physician, provision of funds for treatment, room and equipment at workhouse. Discontinuance of fine and bail privileges in cases of arrest for offenses involving prostitution. Uniform workhouse punishment for offenses involving prostitution. Assignment of beds for dispensary treatment of syphilis at University Hospital.

St. Paul: Provision for treatment of cases held at workhouse. Provision for control and equipment for the treatment rooms at the workhouse. Medical examination of persons arrested for offenses involving prostitution. Discontinuance of fines and bail and uniform workhouse sentences in cases of arrest involving prostitution.

Respectfully,

L. W. FEEZER,  
*Scientific Assistant.*

# PREVALENCE OF DISEASE.

*No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.*

<sup>1</sup> Week ended June 14, 1918.<sup>2</sup> Week ended June 7, 1918.**CURRENT STATE SUMMARIES.****California.**

From the State Board of Health of California, by telegraph, for week ended June 22, 1918:

Most communicable diseases reduced in prevalence. Increase in gonococcus infection and syphilis. Typhoid fever begins its seasonal rise; 24 cases during week, well distributed over the State, except in Imperial County, where many cases reported. One case poliomyelitis in San Diego. Two cases human anthrax; 1 in Amador and 1 in Tuolumne County. Four cases epidemic cerebrospinal meningitis; 1 Los Angeles and 3 San Francisco. Twenty-two cases of smallpox; well scattered throughout the State.

Reported by mail for preceding week (ended June 15):

Cerebrospinal meningitis.....	1	Pneumonia.....	42
Chicken pox.....	129	Poliomyelitis.....	2
Diphtheria.....	54	Scarlet fever.....	51
Erysipelas.....	7	Smallpox.....	18
German measles.....	66	Syphilis.....	36
Gonococcus infection.....	60	Tetanus.....	1
Malaria.....	4	Trachoma.....	2
Measles.....	457	Tuberculosis.....	131
Mumps.....	132	Typhoid fever.....	12
Pellagra.....	2	Whooping cough.....	128

Connecticut.

From Collaborating Epidemiologist Black, by telegraph, for week ended June 22, 1918:

Typhoid fever: Stratford 2, Waterbury 3, total in State 10. Cerebrospinal meningitis: New Britain 1, Waterbury 1. Diphtheria: New London 7, total in State 36. Scarlet fever: New Britain 10, total in State 27. Smallpox: South Windsor 1.

Illinois.

From Collaborating Epidemiologist Drake, by telegraph, for week ended June 22, 1918:

Diphtheria: One hundred and forty-four, of which in Chicago 121, Chicago Heights, 5. Scarlet fever: Fifty, of which in Chicago 31. Smallpox: Thirty-five in Alton, 3 Springfield. Meningitis: Chicago 4. Poliomyelitis: Six, of which in Kewanee Township (Henry County), 1, Okawville Township (Washington County) 1, Chicago 4.

Indiana.

From the State Board of Health of Indiana, by telegraph, for week ended June 22, 1918:

Typhoid fever: South Bend 3 cases. Smallpox: Princeton 3 cases.

Louisiana.

From Collaborating Epidemiologist Dowling, by telegraph, for week ended June 22, 1918:

Infantile paralysis 1, meningitis 1, typhoid fever 65, diphtheria 69, malaria 74.

Massachusetts.

From Collaborating Epidemiologist Hitchcock, by telegraph, for week ended June 22, 1918:

Unusual prevalence. Measles: Fitchburg 64, Haverhill 24, Lawrence 55, Northampton 17, Stoughton (total in June) 25, Waltham 28.

Minnesota.

From Collaborating Epidemiologist Bracken, by telegraph, for week ended June 22, 1918:

Smallpox, new foci: Lesueur County, Tyrone Township; McLeod County, Rich Valley Township; Washington County, Dayton Township; Wilkin County, Champion Township; each 1 case. Wright County, Cokato Village, 5. One poliomyelitis report since June 17.

## Nebraska.

From the State Board of Health of Nebraska, by telegraph, for week ended June 22, 1918:

Smallpox at Neligh.

## New Jersey.

From Collaborating Epidemiologist Bowen, by telegraph, for week ended June 22, 1918:

Unusual prevalence. Measles: Asbury Park. Smallpox: Paulsboro.

## Virginia.

From the State Board of Health of Virginia, by telegraph, for week ended June 22, 1918:

Several cases smallpox Bedford County, 1 Norfolk.

## Washington.

From the State Board of Health of Washington, by telegraph, for week ended June 22, 1918:

One cerebrospinal meningitis South Bend. Thirty-one scarlet fever Tacoma, 19 Seattle. Nine cases smallpox Farmington (Whitman County), and 4 cases Chewela (Stevens County).

## RECIPROCAL NOTIFICATION.

## Minnesota.

*Cases of communicable diseases referred during May, 1918, to other State health departments by department of health of the State of Minnesota.*

Disease and locality of notification.	Referred to health authority of—	Why referred.
Cerebrospinal meningitis: Minneapolis Health Department, Hennepin County.	Doland, Spink County, S. Dak.....	Rural school-teacher near Doland came to Minneapolis May 4, taken sick May 7. Meningococci demonstrated.
Smallpox: Willmar, Kandiyohi County.	Omaha, Douglas County, Nebr.....	Taken sick 5 days after a visit of 2 months in Nebraska.
Minneapolis Health Department, Hennepin County.	Kan a: City, Jackson County, Mo.....	Taken sick in Minneapolis 5 days after exposure to smallpox in Missouri.
	Crosby, Divide County, N. Dak.....	Traveling salesman quarantined on arrival in Minnesota from North Dakota, where he exposed persons in several different places.
	Fessenden, Wells County, N. Dak.....	
	Berwick, McHenry County, N. Dak.....	
	Hamburg, Wells County, N. Dak.....	
	Fargo, Cass County, N. Dak.....	Quarantined on arrival in Minnesota from South Dakota; exposed 8 persons on train.
	Chicago, Cook County, Ill.....	
	Baxter, Jasper County, Iowa.....	
	Wilkinsburg, Allegheny County, Pa.....	
	Meadow, Perkins County, S. Dak.....	4 advanced, 5 moderately advanced, 1 fibroid case, 1 apparently arrested; cases left Mayo Clinic for homes.
	Lemmon, Perkins County, S. Dak.....	
	New Richmond, St. Croix County, Wis.....	
	Rochester, Olmsted County, Minn.....	
	La Crosse, La Crosse County, Wis.....	
	Lewiston, Nez Perce County, Idaho.....	
	Philipsburg, Granite County, Mont.....	
	Brooklyn, Kings County, N. Y.....	
	Sawyer, Ward County, N. Dak.....	
	Trojan, Lawrence County, S. Dak.....	
	Milwaukee, Milwaukee County, Wis.....	
	New Lisbon, Juneau County, Wis.....	
	Rhineland, Oneida County, Wis.....	
	Butternut, Ashland County, Wis.....	
	Casper, Natrona County, Wyo.....	
	Red Deer, Alberta, Canada.....	
Tuberculosis: Mayo Clinic, Rochester, Olmsted County.		

*Cases of communicable diseases referred during May, 1918, to other State health departments by department of health of the State of Minnesota—Continued.*

Disease and locality of notification.	Referred to health authority of—	Why referred.
<b>Tuberculosis—Continued.</b> Pokegama Sanatorium, Pine County.	Hanlontown, Worth County, Iowa.... Ambrose, Divide County, N. Dak.... Fairdale, Walsh County, N. Dak.... Aberdeen, Brown County, S. Dak.... Denzil, Saskatchewan, Canada.....	1 removal on account of death, and 4 cases left Pokegama Sanatorium in an improved condition for homes.
Thomas Hospital, Minneapolis, Hennepin County.	Flandreau, Moody County, S. Dak.... Wautoma, Waushara County, Wis....	1 incipient and 1 moderately advanced case left Thomas Hospital for homes.
State Reformatory, St. Cloud, Stearns County.	Springfield, Bon Homme County, S. Dak.	An apparently arrested case left reformatory for home in South Dakota.
<b>Typhoid fever:</b> Abbott Hospital, Minneapolis, Hennepin County.	Eau Clair, Eau Clair County, Wis....	Convalescent typhoid case left Minnesota for Wisconsin.
Minneapolis Health Department, Hennepin County.	Chelsea, Taylor County, Wis.....	Typhoid case brought for treatment to Minneapolis from Wisconsin.
