

PUBLIC HEALTH REPORTS

VOL. 33

OCTOBER 11, 1918

No. 41

EPIDEMIC INFLUENZA.

Prevalence in the United States.

Influenza has spread practically over the entire United States. The greatest numbers of cases are still reported from the Eastern States, but the number in the West is rapidly increasing.

The following is a summary of the more important reports of the prevalence of influenza received since the last issue of the Public Health Reports was sent to press:

Alabama.—The disease is reported from practically every county in the State.

Arizona.—Epidemics have been reported at Flagstaff, Winslow, and Holbrook.

Arkansas.—Serious epidemics have been reported from several points.

California.—More than 500 cases were reported during the week ended October 5. The disease was scattered over the State.

Connecticut.—On October 7 it was estimated that there were between 18,000 and 20,000 cases in the State.

District of Columbia.—The disease has spread rapidly. On October 8, 2,174 cases were notified.

Georgia.—Cases are reported from many parts of the State.

Idaho.—The disease is present in the State, but the number of cases is not known.

Illinois.—Five hundred to six hundred municipalities have reported cases. The disease is epidemic in Chicago, Peoria, Kankakee, and Rockford, and the number of cases is increasing in many small communities.

Indiana.—The disease has been reported from a number of places.

Iowa.—Cases have been reported from Des Moines, Dodge City, and Onawa.

Kansas.—One thousand three hundred and twenty-seven cases were reported during the week ended October 5.

Louisiana.—The disease is epidemic at Alexandria, Pineville, Lake Charles, and probably at other places.

Maine.—Epidemics have been reported from Eastport and Portland.

Maryland.—On October 8, 861 cases were reported from 15 counties, and 1,308 cases from the city of Baltimore.

Massachusetts.—Influenza was made notifiable October 4. The reports seem to indicate that the number of cases is decreasing, though the disease is spreading in the western part of the State. During the week ended October 7, 1,023 deaths from influenza and 237 deaths from pneumonia were registered in Boston.

Mississippi.—The epidemic is spreading rapidly. Many cases have been reported.

Missouri.—Cases have been reported from St. Louis, Kansas City, and St. Charles.

Nebraska.—On October 7 it was said that the disease was prevalent over practically the entire State; 2,500 cases had been reported in Omaha, and 400 in Lincoln.

New Jersey.—A telegram from Gloucester City dated October 6 stated that there were 2,000 cases in the city.

New Mexico.—Epidemics have been reported from Albuquerque, Gallup, and Carlsbad.

New York.—Epidemics have been reported from Maybrook town, Montgomery (Orange County), North Tonawanda, and Oswego. In New York City 2,500 cases were reported on October 8. Fifty per cent of the deaths in the city during the week ended October 5 were due to respiratory diseases. Schools and theaters have not been closed.

North Carolina.—Epidemics have been reported from many places in the State. On October 4 the situation at Wilmington was said to be improving.

North Dakota.—The disease has been reported as epidemic at Fargo and Rockford, Eddy County.

Ohio.—The disease is generally prevalent throughout the State, especially in the towns and villages.

Oklahoma.—On October 4 it was reported that 1,249 cases had been notified in 24 counties.

Pennsylvania.—The disease is said to be especially prevalent in the industrial districts of Philadelphia and vicinity, in the Lehigh Valley anthracite region, and in scattering sections of the bituminous coal fields.

South Carolina.—The disease is prevalent throughout the State, especially in the northern part.

South Dakota.—Cases are reported from many points in the State.

Tennessee.—The situation at Nashville shows improvement. Seventy-six deaths have been reported in and near this city.

Texas.—The disease has been reported from 77 counties, the number of cases varying from 1 case to 4,000 cases in each county.

Vermont.—On October 7 it was estimated that there were more than 10,000 cases in the State. Practically all parts of the State except the southern counties were affected.

Virginia.—Reports from many parts of the State indicate extensive epidemics.

Washington.—Schools have been closed and public gatherings prohibited at Seattle, Bremerton, Pasco, Prosser, Sultan, and Port Angeles. On October 7 it was estimated that there were 1,000 cases of influenza at Bremerton.

West Virginia.—Outbreaks have been reported at a number of places.

INFLUENZA: AVOID IT AND PREVENT ITS SPREAD.

INSTRUCTIONS ISSUED BY THE DEPARTMENT OF HEALTH AND SANITATION,
EMERGENCY FLEET CORPORATION.

Prepared by L. L. LUMSDEN, Surgeon, United States Public Health Service.

The agents which cause the disease come from the nose and throat of infected persons. Some persons carry the infection without having the disease. So far as possible prevent what comes from the nose or throat of other persons from getting into your nose or throat. Keep in good fighting trim so that if you get the infection you will throw it off quickly.

1. *Avoid needless crowding.* Walking to work, if you have time, is better than riding in a crowded car. By going to bed an hour earlier and getting up a half hour earlier you may have time to walk.

2. *Stay in the open air* and in the sunshine as much as you can.

3. *Breathe clean air and plenty of it.* Breathe through your nose. Avoid all poorly aired places to which it is unnecessary for you to go. Keep the windows open where you sleep and, if practicable, where you work. Rooms a little too cool are better than those a little too warm.

4. *Use plenty of covering* to keep warm while you sleep and loose-fitting clothes to keep you comfortable while you are awake. Keep your feet dry and warm.

5. *Avoid coughing, sneezing, or snuffling persons* and do not cough or sneeze on others. The firing range of a careless cougher or sneezer is at least 3 feet. Get beyond the "barrage" of infected droplets. If necessarily attending the sick, wear a gauze mask over the nose and mouth. Wash your hands thoroughly after handling a person sick with grip and after handling anything likely to be smeared or sprayed with the secretions from the nose or mouth of an infected person.

6. *Wash your hands thoroughly* immediately before eating and do not put your fingers in your mouth or nose. By shaking hands or by handling door knobs or other objects touched by others you may get something on your hands which will do damage if you put it into your nose or mouth.

7. *Don't use a napkin, towel, spoon, fork, glass, or cup which has been used by another person and not washed.* Consider the safety and satisfaction of using clean eating and drinking vessels, such as private (individual) durable cups or destructible paper cups, and do not patronize dirty eating and drinking establishments.

8. *Keep away from houses where there are influenza cases unless necessary* for you to visit them.

9. *Keep up your general health* (1) by using, inside and outside, plenty of clean water. (2) by eating clean, wholesome food, (3) by sleeping at least seven hours out of each 24 hours, (4) by keeping the bowels regular, and (5) by temperance. Clean pasteurized milk and clean lemonade are good antigrip drinks, while alcoholic drinks ("booze") may make you subject to the disease.

10. *Buck up.* Be cheerful. We'll get over the grip trouble just as we will over every other obstacle on our road to Berlin.

What to Do if You Get Influenza.

Influenza may begin as a common cold or more severely with fever, headache, and pains in the muscles or with a chill.

If you have reason to suspect you have the disease do at once the following:

1. Report to the yard doctor or nurse or go to bed and call your physician.

2. See that the bedroom at all times is well flooded with fresh air by having the windows open.

3. Use plenty of bedclothing to keep warm.

4. Drink plain water freely.

5. Take a laxative.

6. Eat plain bland foods, such as eggs, broth, soft toast and milk.

7. Have at hand pieces of cloth or soft paper to hold over your nose or mouth when you cough, sneeze, or spit, and put these cloths containing the secretions from the nose or throat into a paper sack to be destroyed by burning.

8. Stay in bed at least 48 hours after you think you are well. Getting to bed promptly and staying in bed until you are well is very important. If it turns out that you have had only a common cold, staying in bed is the best treatment for it.

INDUSTRIAL FATIGUE.

INVESTIGATION BY MEANS OF FACTORY STATISTICS.

A manual for field research in industrial fatigue by P. S. Florence, scientific assistant, United States Public Health Service, was recently published¹ for the purpose of summarizing the methods which have been most usefully employed in the study of industrial fatigue. It is the opinion of the author that the experience picked up painfully and wastefully by means of trial and error can now be taught as a body, logically and succinctly. He believes, too, that the crying need is for more and more investigation and hopes that all who can will join in research along the lines laid down in this volume, in order to strengthen the foundations and broaden the range of our knowledge of human fatigue and of its incidence in industry.

The events that can be observed and recorded in factories to throw light on fatigue are summarized in this volume as follows:

- A. The output rate per given period of time.
- B. The consumption of mechanical power at any given moment.
- C. The rate of accidents per given period of time.
- D. The proportion of spoiled work to output.
- E. The proportion of sickness and unrest among the industrial population.

A chapter is devoted to each of these methods. The reliability and value of each method is discussed and suggestions given for the elimination of any ambiguity which may exist in the statistics.

Prof. Florence states that any complete investigation of industrial fatigue would fall into three sections:

- A. Measurement of variations in working capacity.
- B. Measurement of variations in length and intensity of activity and in industrial conditions.
- C. Correlation of these two.

The greater part of the monograph is devoted to a consideration of the problems arising in connection with a statistical study along the lines outlined.

¹ Use of Factory Statistics in the Investigation of Industrial Fatigue. A Manual for Field Research. By Philip Sargent Florence. Vol. LXXXI, No. 3 (whole No. 199), Studies in History, Economics, and Public Law, edited by the faculty of political science of Columbia University. Columbia University, 1918.

Your money should not be neutral; enlist it in the Fourth Loan.

PREVALENCE OF DISEASE.

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring.
