

PUBLIC HEALTH REPORTS

VOL. 34

NOVEMBER 28, 1919

No. 48

THE VALUE OF DETENTION AS A RECONSTRUCTION MEASURE.¹

By C. C. PIERCE, Assistant Surgeon General, United States Public Health Service.

The value of detention as a reconstruction measure should be of vital interest to the American Association of Obstetricians and Gynecologists, for it is to this group of the profession more than to any other, except, possibly, the psychiatrists, that society must look for the development of that branch of the peace-time program that has to do with the prevention and control of venereal diseases.

Many of you are no doubt familiar with sections 12 and 13 of the selective service act. These two sections have perhaps surpassed anything thus far known in national legislation. Section 12 prohibited the distribution of liquor to troops; section 13, suppressed prostitution, not only in the immediate vicinity of camps, but in a zone whose limits were from 5 to 10 miles surrounding each mobilization center, and further where the necessity for extension presented itself. To enforce these laws was no small task. The offenders, as well as their protectors, were extremely difficult to manage. The law enforcement division of the Commission on Training Camp Activities, which was organized September, 1917, was given the responsibility for enforcing the law contained in these two remarkable sections. The present discussion is confined to the work in connection with section 13.

In September, 1917, when the commission was formed, a committee on protective work for girls was created as one of the constituent parts of the commission. The function of this committee was to provide for young girls in the mobilization areas on the assumption that these girls needed protection to keep them from becoming sex offenders. Six months' work demonstrated that the number of delinquent girls in the vicinity of military camps was so great that a reorganization of the committee on a new basis was necessary. In April, 1918, the section on women and girls was created as a part of the law enforcement division of the Commission on Training Camp Activities, authorized to deal primarily with women and girls who were sex offenders. The protective and recreational work with the girls who were not sex offenders was left to local organizations.

¹ Read at the meeting of the American Association of Obstetricians and Gynecologists, Cincinnati, Ohio, September 15, 1919.

One of the first very prominent problems confronting the commission was how to provide detention for women and girls arrested under this act. It is to be borne in mind that the cantonments were, with but few exceptions, located in comparatively small southern cities where proper custodial care even for ordinary offenders was quite undeveloped. To meet this emergency the President set aside from his War Emergency Fund, generally spoken of as the National Security and Defense Fund, the amount of \$250,000 to provide suitable facilities for the custody and rehabilitation of girls and women who were a menace to the men in training. A special section was added to the Commission on Training Camp Activities, known as the section on reformatories and detention houses.

That the offenders arrested under section 13 were mainly prostitutes was not surprising, and that they should be found infected with venereal disease was expected. Medical supervision then became the most important service in the detention homes created in the extra-cantonment zones. The Public Health Service assumed the responsibility for the care of the delinquents. Very little attention was paid during the war to reconstruction work, because of the urgent necessity of other branches of the work and the lack of adequately trained personnel.

Practically all the detention stations which were established were of an emergency nature, as immediate action was necessary to meet the unusual situation that had been created. In a few instances it was possible to arrange with already existing institutions to admit and care for the persons held for detention; but this was the exception rather than the rule. In fact, during the year 1918 there were only about eight States that were making provision for the detention of venereally infected women other than that of confining them to county and city jails. Only one State had any provision for the detention of colored women.

As a result of the efforts of the various Federal agencies, 34 States provided more or less adequate detention measures for persons infected with venereal diseases, detention hospitals being established usually in towns and cities adjacent to military camps. A list of these detention hospitals, with their location, was published in Reprint No. 521 from Public Health Reports of May 2, 1919.

Most of these detention homes were temporary structures, and the equipment and personnel varied considerably, depending upon the amount of funds available and the possibility of securing trained workers to perform the duties of matrons and attendants. Notwithstanding the difficulty attendant upon providing proper detention facilities, these institutions fulfilled a very essential and important function in limiting the spread of venereal diseases in the civilian areas adjacent to Army and Navy camps.

The establishment of these institutions was received by the local communities in widely varying manners. In some places the officials and social agencies gave the institutions most cordial and intelligent support, while in others practically no help could be counted upon from the local community. Likewise, some degree of criticism was directed toward many of the institutions because the critics failed to understand the object to be accomplished. Several articles were written and published in various magazines criticising the action of the Government in detaining venereally infected women, it being stated that such a procedure was a revival of the plan for regulating prostitution that has for many years been employed in various European countries practically without any success in its effect upon the control of venereal diseases.

That such a view was erroneous can easily be shown by any one familiar with the facts. The civil and military authorities were confronted with a condition, not a theory—a condition which required the immediate isolation of as many venereally infected persons acting as spreaders of disease as could be quickly apprehended and quarantined. It was not a measure instituted for the punishment of prostitutes on account of infraction of the civil or moral law, but was strictly a public health measure to prevent the spread of dangerous, communicable diseases.

The law specifically stated that the measures instituted were for the protection of the health of the soldiers and sailors. The soldiers and sailors obviously contracted their venereal infections from infected women. Therefore, for the purpose to be accomplished, it was not necessary to isolate venereally infected men prior to their induction into military service.

The assembling of large numbers of venereally infected prostitutes in these various institutions offered a splendid opportunity for sociological and psychological investigation in regard to the causes of prostitution in general, and for studying the type of women that furnished the great bulk of prostitutes.

History sheets of more than 9,000 individuals were collected among the 30,000 women who were apprehended during the war. These history sheets are now the property of the Interdepartmental Social Hygiene Board. Up to this time it has not been possible to study and tabulate these history sheets, but it is expected that this work will be accomplished some time in the near future. Undoubtedly the data so obtained will be of great value to all persons interested in the problem of the control of venereal diseases.

Intensive studies were made upon two groups of detained women in two separate States. The data are now ready for publication and will soon appear as a bulletin of the Public Health Service.

At most of the detention stations some effort was made to provide both recreation and occupation for the detained women. As these women were being isolated as a health measure, it was necessary to

release them from detention as soon as they ceased to be a menace to the soldiers and sailors, as determined by finding them free from venereal infection in a communicable form.

Now, detention of persons suspected of being infected, or known to be infected, is absolutely imperative in peace time, as well as in war time. Prof. Albert Neisser, of Breslau, discussing "War, Prostitution, and Venereal Diseases," says:

"The greatest possible sanitation of prostitution must be provided for, so far as other efforts are unsuccessful, by arresting the prostitutes. I ask myself why this sharp but so useful measure is not relentlessly resorted to. This method of elimination is the most effective, since sanitation in the case of the most prevalent venereal disease, gonorrhoea, is impossible anyway, and because, considering the enormous number of visits of the individual females, not even a daily medical examination would accomplish the purpose, aside from the impossibility of performing a really good examination of prostitutes.

"As regards syphilis, sanitation is much more conceivable. The capacity of all prostitutes for transmitting infection could easily be much lowered if every single one (without bothering about a special diagnosis) were subjected to an energetic salvarsan treatment, or, perhaps, a treatment with salvarsan combined with mercury. If there should actually be one among them uninfected with syphilis, the treatment would surely do her no harm."

The word "detention" unfortunately carries with it the stigma of a penal institution just as "venereal diseases" implies to the lay mind diseases of venery or immorality. Effort must be made to inculcate into the minds of the public that while detention is imperative as a sanitary measure it should not brand the detained individuals as criminals.

The two years of war have given us volumes of data proving conclusively that the prostitute or sex offender requires individual correctional care to overcome the handicaps of mental inferiority, physical defects, educational neglect, and hereditary and environmental influences.

The detention home has a definite place in the reconstruction program, but it must be a detention home only in the sense that individuals are detained until such time as they can be returned to society equipped to take their places as respectable and respected citizens.

Without posing as an authority on this important subject or attempting to prescribe dogmatic rules and regulations for establishing and operating detention homes, I might suggest several obvious rules to be followed:

The ideal location for a detention home is in the country. This gives opportunity for outdoor exercise and work, which are of great rehabilitating value. There must be sufficient space in order that the mentally normal can be separated from the subnormal, and that the girls

can be separated from the women, because the problem of moral contagion is as great as that of physical contagion.

Competent medical attendance is essential. Adequate hospital facilities for the care of the venereal and other infections are imperative.

The atmosphere of the place should be as homelike as possible; the personnel should be selected from women who are specially qualified and trained and who have a sympathetic interest and a belief in the movement.

To merely use a detention home for the cure and treatment of venereal diseases is to promote a vicious cycle. Unless the individual detained is given a vocational training whereby a decent economic status can be maintained, the detention home contributes to delinquency rather than corrects it.

The responsibility of the detention home in the matter of correctional therapy extends beyond its walls. This responsibility is met only when an efficient follow-up system is established and maintained. William Healy, in his book, "The Individual Delinquent," says, with reference to the proper methods of treating delinquents:

"Comparable is the new social service work done in connection with hospitals, the principle being that if the hospital has given its services as far as the convalescent stage, it is a matter of the greatest economy to carry them still further and to see that the patient is restored to social efficiency. Now, the hospital patient's inefficiency is mostly a negative quantity. The ex-prisoner's failure is a positive menace. Society has undertaken to treat him for his misconduct; it desires his moral well-being and general welfare. The penal failure, which is everywhere witnessed by recidivism, can best be prevented by after-care methods that are based on full appreciation of the offender's needs and possibilities. Perfunctory parole work is to be regarded as a weak effort. The same is true of aid to discharged prisoners by whatever agency. Successful relief must be based on understanding of the individual and his relation to his environment."

The war-time detention house was designed primarily to meet an emergency to protect the fighting men from venereal infections. The peace-time detention house should be conducted to meet the needs of the peace-time program; it must be designed to protect the working forces and posterity from venereal infections. The peace-time detention home, however, must fulfill certain definite requirements: It must provide correctional facilities as well as medical facilities; it must be a house of detention, a reformatory, a protectorate, a reconstruction station all in one; and it must be a part of the State venereal disease control program, supported by legal and executive machinery and backed by enlightened public opinion.

STEAM AS A BEDBUG ERADICATOR.

The use of live steam to eradicate bedbugs has been practiced very successfully by the Booth-Kelly Lumber Co. of Eugene, Oreg., an account of which has been furnished the United States

Public Health Service by Dr. T. Tharaldsen, of Portland. The unqualified success of this company in ridding its bunkhouse of bed-bugs by means of steam is particularly interesting because of the size of the building and the large number of rooms it contains.

The bunkhouse is a T-shaped building of 70 rooms, each 10 by 12 feet, and has an 8-foot hallway running the full length of each wing. It is of ordinary frame construction, with 2 by 4 inch studding, ceiled with $\frac{1}{2}$ -inch ceiling, and is of rustic finish outside. The building is heated by steam which is supplied by the mill boiler plant. The heating system consists of radiators in the halls and four $1\frac{1}{2}$ -inch pipes running the full length of the building and exposed in each room. These pipes are tapped in each room with a $\frac{1}{4}$ -inch tap and plugged with an ordinary pipe plug.

In heating the building the pressure in the steam pipes is reduced by means of a reducing valve to 10 or 12 pounds to the square inch; but in steaming to superheat the building to kill the bedbugs the reducing valve is opened and the pressure is increased to 80 or 100 pounds. The windows and doors are shut, but no attempt is made to caulk any of the cracks. Articles which might be injured by steam are removed, but all bedding, mattresses, and clothing are left in the rooms. The plugs in each room are opened and the valves on the radiators in the halls are turned on. It requires about two hours to raise the temperature of the building to 160° F. This temperature is then held for approximately three hours. After the steaming, a great many of the dead bugs are found on the floors and under the beds.

In the first trial made it was found that a temperature of about 150° F. killed all the bugs in sight, but in this trial only one room at a time was steamed and this method failed to get the bugs between the walls and those deeply imbedded in the mattresses. The method of steaming all of the rooms at the same time proved more effective.

The company states that two months after the steaming no signs of bedbugs had been found, and that it is the intention to steam the bunkhouse three or four times a year.

THE BOYLSTON MEDICAL PRIZES.

Boylston medical prizes, which are open to public competition, are offered for the best dissertation on questions in medical science proposed by the Boylston Medical Committee.

At the annual meeting held in Boston in 1916, a prize of \$300 was awarded to an essay entitled "Studies of the Streptococcus of Smith," by Wilson G. Smillie, of Cambridge, Mass.

For 1919 there is offered a prize of \$300 and the Boylston Prize Medal for the best dissertation on the results of original research in medicine, the subject to be chosen by the writer. The Boylston

Prize Medal will be added to the money prize only in case the winning essay shows special originality in the investigations detailed.

In awarding these prizes, preference will be given to dissertations which exhibit original work; but if no dissertation is considered worthy of a prize, the award may be withheld.

Each dissertation must bear in place of the author's name, some sentence or device, and must be accompanied by a sealed packet bearing the same sentence or device, and containing the author's name and residence within.

Any clew by which the authorship of a dissertation is made known to the committee will debar such dissertation from competition.

Dissertations must be printed or typewritten, and their pages must be bound in book form.

All unsuccessful dissertations are deposited with the secretary, from whom they may be obtained, with the sealed packet unopened, if called for within one year after they have been received.

By an order adopted in 1826, the secretary was directed to publish annually the following votes:

1. That the board does not consider itself as approving the doctrines contained in any of the dissertations to which premiums may be adjudged.
2. That, in case of publication of a successful dissertation, the author be considered as bound to print the above note in connection therewith.

Dissertations entered for this prize must be in the hands of the secretary, Dr. H. C. Ernst, Harvard Medical School, Boston, Mass., on or before December 31, 1919.

The Boylston Medical Committee is appointed by the President and Fellows of Harvard College, and consists of the following: Dr. William F. Whitney, chairman; Dr. Harold C. Ernst, secretary; Dr. William T. Porter; Dr. Edward H. Nichols; Dr. Reid Hunt; Dr. Henry A. Christian, and Dr. John Warren.

The secretary of the committee, Dr. Harold C. Ernst, states that a similar announcement of prizes will be made for 1920.

"TO-DAY'S WORLD PROBLEM IN DISEASE PREVENTION."

The United States Public Health Service has recently published a 136-page book on venereal diseases, entitled "To-day's World Problem in Disease Prevention." It is a popular, nontechnical discussion of syphilis and gonorrhea by Dr. John H. Stokes, Chief of the Section of Dermatology and Syphilology of the Mayo Clinic, Rochester, Minn.

A limited number of copies of this book are now available, and until the supply is exhausted a copy will be sent to anyone who can use it advantageously. Applications should be made by letter addressed to the Surgeon General, United States Public Health Service, 228 First Street N. W., Washington, D. C.

DEATHS DURING WEEK ENDED NOV. 15, 1919.

From the "Weekly Health Index," Nov. 18, 1919, issued by the Bureau of the Census, Department of Commerce.

Deaths from all causes in certain large cities of the United States during the week ended Nov. 15, 1919, infant mortality (per cent), annual death rates, and comparison with corresponding week of preceding years.

During the week ended November 8, 1919, one case of rabies in animals was reported at Detroit, Mich., and three cases were reported at Kansas City, Mo.

SCARLET FEVER.

See Telegraphic weekly reports from States, page 2717; Monthly summaries by States, page 2723; and Weekly reports from cities, page 2735.

SMALLPOX.

Petersburg, Alaska—October, 1919.

During the month of October, 1919, three cases of smallpox were reported at Petersburg, Alaska.

SMALLPOX—Continued.

Prevalence in the United States, June to September, 1919.

The following table shows the number of reported cases of smallpox in States for which data are available for the four months June to September, 1919, compared with the average number of cases reported for the same months during recent years. Where information was available, the averages were computed for the five years 1914 to 1918, inclusive. For many States data were not accessible for the full five years, and the averages were computed for a less number of years, as shown by the footnotes. In all cases the averages are for years later than 1913.

The figures indicate a general increase in the number of reported cases of smallpox in the United States during these months of 1919 as compared with the average of preceding years, the increase being more than 50 per cent of the average.

Smallpox in the United States, June to September, 1919, compared with the average for the same months of preceding years 1914 to 1918, inclusive.

FOREIGN.

ARGENTINA.

Plague—Buenos Aires—1901-1919.

The following statistics of the occurrence of bubonic plague at Buenos Aires, Argentina, during the period 1901-1918, and January to September, 1919, have been recently published by the office of the Asistencia Publica of Buenos Aires:

Year.	Cases.	Deaths.	Year.	Cases.	Deaths.
1901	20	2	1911	70	12
1902	22	2	1912	51	8
1903	27	3	1913	64	2
1904	18	1	1914	72	6
1905	25	4	1915	42	3
1906	89	21	1916	24	3
1907	125	21	1917	49	4
1908	38	1	1918	41	11
1909	116	7	1919 (Jan. 1 to Sept. 1)	122	31
1910	38	1			

It will be observed that an increase in the number of cases was reported for the period January 1 to September 1, 1919, over the number reported for any complete year since 1901, except the year 1907, and that the number of deaths reported for the same period in the year 1919 was greater than that reported for any complete year since 1900.

BERMUDA.

Epidemic Dengue.

Dengue fever in epidemic form was reported prevalent throughout the colony November 1, 1919.

BRAZIL.

Epidemic Smallpox—Bahia.

The board of health of Bahia reports the occurrence of an outbreak of epidemic smallpox, with a total of 1,203 cases notified from August 1 to October 23, 1919, with 500 deaths; 145 cases were notified in August, 356 in September, and in October 702 cases. Only cases removed for treatment to the isolation hospital have been reported; a large number of cases remained in private homes.

BRITISH WEST INDIES.

Spleen Census, 1918—Trinidad and Tobago.

Council Paper No. 100 of 1919, for the colony of Trinidad and Tobago, British West Indies, entitled "Malaria Report, Spleen Census, 1918," gives the following information:

A spleen census taken throughout the colony of Trinidad and Tobago, beginning September 3 and finished December 4, 1918, in all districts of the colony, shows results as follows:

Number of children examined, 20,590; number of children with enlarged spleens, 2,420; percentage of children with enlarged spleens, 11.8.

The highest percentage of enlarged spleens was obtained in the Mayaro district, viz, 70.2 per cent of 545 children examined, and the lowest in the Port of Spain district, viz, 0.1 per cent of 4,972 children examined.

The result obtained in Arima district appears remarkable, viz, 44.20 per cent in 1918 as compared with 7.9 in 1913-14 and 1.09 in 1914, and is probably explained by unusual malarial outbreaks in that district.

In eight districts there was a distinct increase in the enlarged spleen rate in 1918 as compared with 1913-14. In all the 11 other districts in which the census was taken there was a satisfactory decrease of the rate, and in the whole colony there was a decrease from 17.9 per cent in 1913-14 to 14.1 in 1914 and 11.8 in 1918.

Comparative Results—Mauritius—Ceylon—Trinidad and Tobago.

The table following shows the results of spleen examinations in Mauritius, Ceylon, and Trinidad and Tobago:

Colony.	Date of census.	Number of children examined.	Number of enlarged spleens.	Percentage of enlarged spleens.
Mauritius.....	1907-08..	31,022	10,595	34.2
Ceylon.....	1908.....	92,258	31,421	34.1
Trinidad and Tobago.....	1913-14.....	17,495	3,134	17.9
Do.....	1914.....	25,927	3,658	14.1
Do.....	1918.....	20,590	2,420	11.8

CANADA.

Smallpox—Province of Ontario.

An officer of the Public Health Service visited Toronto, Ontario, Canada, November 17, 1919, for the purpose of securing information relative to the outbreak of smallpox. He reports that 368 cases of smallpox and 204 cases of chicken pox were reported in Toronto from November 1 to 15. During the same period 178 cases of small-

pox were reported from other places in the Province of Ontario, including Hospital Orillia, 35 cases; Stratford, 19; Woodstock, 11; Stouffville, 10; Dunwich, 10; and Kriegerdorf, 9 cases.

From January 1 to October 31, 1919, 8 cases of smallpox and 912 cases of chicken pox were reported in Toronto. The smallpox is very mild in form, and the health officer of Toronto is of the opinion that many cases of this disease have been diagnosed as chicken pox.

On October 17 the number of cases reported in the city of Toronto was said to be decreasing.

CUBA.

Communicable Diseases—Habana—Oct. 21-31, 1919.

Communicable diseases were notified at Habana from October 21 to 31, 1919, as follows:

Disease.	New cases.	Deaths.	Remaining under treatment Oct. 31, 1919.	Disease.	New cases.	Deaths.	Remaining under treatment Oct. 31, 1919.

GREAT BRITAIN.

Plague Rats on Vessel—Liverpool.

The finding of plague-infected rats on the steamship *Musician*, which arrived October 24, 1919, at Liverpool from South American ports, has been reported. The *Musician* left Pernambuco, Brazil, September 5, 1919.

GREECE.

Sanitary Stations—Macedonia.

The ministry of public assistance has decided to open sanitary stations in eastern Macedonia for combating epidemic conditions, particularly as regards malaria.

INDIA.

Anthrax—Madras Presidency.

During the month of July, 1919, 269 fatal cases of anthrax in stock were reported in the Madras Presidency, India, by the Civil Veterinary Department.

MEXICO.

Dengue—Vera Cruz.

Dengue fever was reported present with many cases at Vera Cruz, Mexico, November 1, 1919.

PLAQUE ON VESSEL.

Steamship "Nankin" at Port Said.

The steamship *Nankin* from London via Marseille arrived at Port Said, Egypt, with nine cases of plague on board occurring among the crew from July 10 to the date of arrival at Port Said. On July 13 two additional cases were removed from the vessel and to July 17, 1919, a total of 17 cases was reported landed from the *Nankin* at Port Said.

The *Nankin* left London June 26, Marseille July 6, and Malta July 8, 1919. The finding of six dead rats during the voyage was reported by the ship's surgeon. At Marseille the *Nankin* took on mail from Rotterdam and merchandise, and the ship's officer who had charge of the loading stated that a great number of fleas were observed on the bags containing the mail and merchandise. On July 10 a cat on board was found to be sick with a cervical bubo and a kitten was found with inguinal plague. On the same date a Lascar member of the crew was taken ill but without buboes, and on July 11 three other Lascars were attacked but exhibited no buboes. On July 12 a Lascar was taken ill with buboes present and buboes developed in the four cases previously reported.

The history of the *Nankin* shows that the vessel left Bombay May 3, 1919, stopping at Aden, where two suspect cases of plague were landed. On reaching Suez the vessel received telegraphic report that the cases landed at Aden had been declared negative. The *Nankin* arrived at London May 29, remaining there until June 26, leaving the Thames June 27, 1919.

SPAIN.

Plague—Barcelona.

The occurrence of five cases of plague at Barcelona during September was reported October 6, 1919. The cases occurred among laborers employed in a warehouse.
