No. 47

## MALTA FEVER IN SOUTHWESTERN UNITED STATES.

WITH SPECIAL REFERENCE TO A RECENT OUTBREAK IN PHOENIX, ARIZ.

By G. C. LAKE, Passed Assistant Surgeon, United States Public Health Service.

The first case of Malta fever known to have originated in the United States was reported in 1905 by Col. C. F. Craig,<sup>1</sup> Medical Corps, United States Army. The patient was a nurse who contracted the disease in Washington, D. C., probably from nursing infected soldiers. Craig also reported nine other cases occurring in soldiers returned from the Philippines. In this report he stated that he was convinced that Malta fever existed in the warmer portions of the United States. This statement can scarcely be classed as a prediction that it would be found to exist, but is rather a conservative opinion based on a careful study of the disease and the knowledge that conditions favorable to its existence and spread were present in the warmer portions of the United States.

Six years later, Ferenbaugh,<sup>2</sup> Medical Corps, United States Army, reported five cases of Malta fever in Texas, the first cases of the indigenous occurrence of this disease in the United States. All five had worked with goats and had drunk goat's milk. Following this report, Ferenbaugh and Gentry, Medical Corps, United States Army, were detailed by the Surgeon General of the Army to make some field investigations of the disease in Texas. Their investigations, reported in 1911,<sup>3</sup> show that Malta fever had in all probability been present in Texas at that time for at least 25 years. They made serological tests on 128 goats and found 19.4 per cent positive for Malta fever; but, because of the unfavorable time of year for such work, were unable to isolate *B. melitensis* from any of the goats. They made positive diagnoses, by serological tests, on seven human cases in addition to the five first reported by Ferenbaugh. In two of these cases they recovered *B. melitensis*. They point out that the favorable

time to study the disease is during the spring and early summer, during which time the goats are kidding and are in full milk, and not in the fall, at which time their investigations were made.

Yount and Looney,<sup>4</sup> in 1912, reported five cases of Malta fever, all occurring in persons connected with the goat industry, near Wagoner, Ariz. Yount,<sup>5</sup> in 1913, reported an additional case in which he isolated *B. melitensis*, and four other cases occurring in the practice of Dr. J. C. Wilson at Wilcox, Ariz., two of which were positive by agglutination tests made by Capt. C. L. Cole, Medical Corps, United States Army, at Fort Sam Houston, Tex.

During the summer of 1922 the first outbreak of Malta fever in any city in the United States occurred in Phoenix, Ariz. The outbreak resulted from the sale of goat's milk by a high-class dairy, whereas practically all of the indigenous cases previously reported in this country were directly connected with the goat-raising industry. More than 30 cases were positively diagnosed, and doubtlessly many others occurred. Two fatalities resulted in patients already more or less invalidated by other infections. This series of cases constitutes the first, in one locality, of sufficient size to warrant being called an epidemic. It was the privilege of the writer to be detailed to Arizona to cooperate with the State and local authorities in the investigation of Malta fever in Phoenix in particular, and of its occurrence in the State in general. The important facts obtained in connection with the Phoenix outbreak are briefly as follows:

Cases of a peculiar febrile disease began to appear in Phoenix about the middle of May, 1922, in which a variety of provisional diagnoses, including typhoid fever, rheumatic fever, malaria, septicemia, and influenza, were made. After several weeks Malta fever was suspected, following which cultures of *B. melitensis* were secured from the Hygienic Laboratory, United States Public Health Service. Agglutination tests made at the Pathological Laboratory of Phoenix, on August 3, and confirmed later by the Hygienic Laboratory, established beyond doubt the presence of Malta fever in the city. The fact that the presence of Malta fever was not recognized earlier is an indication of the difficulties attending its early recognition.

By the end of September, 35 cases had been located, most of which had probably been infected before the end of June. In September a number of these cases were sufficiently typical clinically to warrant a diagnosis of Malta fever, even in the absence of a known source of infection, or of positive serological tests. Temperature records could be secured in only 12 of the cases, 9 of which showed the wave-like effect, from which the name "undulant fever" was first given

the disease by Hughes, and the other 3 were not inconsistent. The length of time that the fever lasted varied from 60 days to more than 150 days; one or two of the cases are, at this writing, still febrile. The cases varied in severity from ambulatory to fatal. However, of the two patients who died, one was a chronic case of tuberculosis and the other had probably suffered from some type of focal infection. All the cases, with the exception of one patient who objected to having blood taken, were positive for Malta fever by the agglutination test. It is interesting to note, too, that their serums caused an agglutination of *B. abortus* (Bang) equally as well. *B. melitensis* was recovered from two of the cases.

The investigations showed that all but three of the patients had drunk goat's milk supplied from the same dairy, and that the possibility of these three having drunk of this milk also could not be excluded. This milk was placed on sale April 7, 1922. Our investigations showed that nearly all the patients were probably infected by June 1, although the sale of the goat's milk was not stopped until August 3, 1922. The explanation for this is that the milk sold came from two different herds of goats, which for convenience are designated as herd A and herd B. Up to about June 1 all of the goats' milk used came from herd A; soon after that time the milk from herd A was mixed more or less with milk from herd B and finally almost or entirely replaced by it. Agglutination tests made on serums from 115 of the goats from herd A gave 18.3 per cent positives. Gentry and Ferenbaugh (*loc. cit.*), in Texas, found 19.4 per cent of positives in 128 goats examined. Serums from 143 goats from herd B gave only two positives. It seems quite probable that herd B was free from infection when brought down from the hills early in the spring and became infected from herd A. We are particularly indebted to the Bureau of Animal Industry for collecting most of the goat serums. The herd A goats were on the range during the writer's stay in Phoenix, and it was impracticable to obtain their serums until they were rounded up for shearing. Dr. M. Shipley, veterinary inspector, stationed at Phoenix, kindly volunteered to secure the serums for us at that time.

From information obtained from Arizona State and local authorities and various physicians, we are certain that Malta fever has occurred in several widely separated areas of the State. We wish especially to mention a series of five cases, all in the same family, occurring near Phoenix in 1908, as they constitute the first that occurred in the State in which we could get a history. These cases were attended by Dr. H. K. Beauchamp, and from his account of them, and an almost classical description of his own illness and that of the others obtained first hand from one of the patients, we are convinced that these cases were Malta fever and that the disease has

been present in Arizona at least 14 years. Two of the other four cases had left the State, but are known to be in good health. One died in 1909, probably from the disease, and one was killed in the late war. It is of interest to note that two of them, after suffering with the disease for several months in Arizona, being told by their physician that they might have tuberculosis, and believing that they were in the last stages, "went back home to die," one to Missouri the other to Oklahoma; but instead of dying, both recovered completely after about six months.

#### GENERAL CONSIDERATIONS.

From the investigations of Gentry and Ferenbaugh, Malta fever has existed in Texas for at least 36 years, and, from our own, it has existed in Arizona for at least 14 years. Tests made on goats in both States have shown an infection of representative herds of nearly 20 per cent. The same subtropical climate, together with numerous goat herds, exists from Texas to the Pacific coast. It is well known that goats are shipped, or are driven, back and forth between the Southwestern States and into other States as well. Whether infected goats will continue to have Malta fever and spread the same when shipped from our Southern States with subtropical climates to Northern States has not been investigated; but from the researches of Mohler and Hart <sup>6</sup> it is altogether probable that they will. With these conditions present, we are convinced that Malta fever must exist in New Mexico and California. There is no doubt that it exists in Mexico; at least one case developing in Mexico was studied by Woolsey <sup>7</sup> in St. Louis in 1918.

Goat's milk is being sold at the present time in a number of cities in the United States, usually as a fancy article and at a high price. It is consumed largely by infants and invalids, particularly by patients with tuberculosis, and in these persons Malta fever could exist for a long time without being recognized. Some of the Phoenix cases were patients with quiescent tuberculosis, fever-free for months. These cases, with a Malta-fever infection superimposed, behaved as cases in which tuberculosis had suddenly become active, and, in the absence of an epidemic, would never have been diagnosed without the most careful observation. The difficulty in recognizing so insidious a disease in infants needs no comment.

#### SUMMARY.

1. Malta fever has, in all probability, existed in Texas for at least 36 years and in Arizona for at least 14 years. Absolutely authentic cases have been known in Texas since 1911 and in Arizona since 1912.

<sup>6</sup> Mohler, John R., and Hart, Geo. H.: Malta Fever and the Maltese Goat Importation. 25th Annual Report, B. A. I., 1908, 279-295.

<sup>7</sup> Woolsey, Russ. A.: Missouri Med. Assn. 15:163.

2. Conditions favorable for the existence and spread of Malta fever are present in all the Southwestern States.

3. More than 30 authentic cases of Malta fever occurred in the recent outbreak at Phoenix, Ariz., concerning which the following can be stated:

- (a) These cases were typical clinically and serologically; and in two cases *B. melitensis* was recovered.
- (b) Goat's milk is known to have been used in all but three of the cases and can not be excluded in those three.
- (c) Tests made on the goats supplying this milk gave 18.3 per cent positives for Malta fever.
- (d) The disease remained unrecognized for at least six weeks, under conditions unusually favorable for its recognition.

4. Goat's milk is being sold in a number of cities in the United States.

#### CONCLUSIONS.

From the evidence at hand we believe the following conclusions are warranted:

1. Malta fever is probably endemic in certain sections of the southwestern part of the United States and in some parts of Mexico.

2. It is extremely difficult to recognize Malta fever early in the course of an outbreak, from the clinical symptoms alone; usually the possibility of its presence is not considered, and laboratory tests are not made for some weeks.

3. The prohibition of the sale of goat's milk in cities where an ample supply of cow's milk is available should be seriously considered by health officers. Where it is necessary to allow the sale of goat's milk to secure sufficient fresh milk, efficient pasteurization under constant supervision by the health authorities should be required.

*Acknowledgments:* Acknowledgment is made of the assistance and cooperation given by the State superintendent of public health, Dr. A. M. Tuthill, by the director of the State laboratory, Miss Jane Rider, by the Pathological Laboratory, by the local health authorities, and by the medical profession of Phoenix.

---

#### MORTALITY FROM CANCER IN THE UNITED STATES, 1921.

The Department of Commerce announces that the returns compiled by the Bureau of the Census show that over 76,000 deaths were due to cancer in the death registration area of the United States in 1921, and, assuming that the remainder of the United States had as many deaths from this cause in proportion to the population, the total number of deaths from cancer in the entire United States for

1921 was 93,000, whereas for 1920 the number is estimated as 89,000, or 4,000 less than for 1921.

The trend of the cancer death rate is upward, the rate for 1921 being higher than that for any earlier year in 23 of the 34 States for which rates are shown in the accompanying table. The cancer death rate in the registration area in 1921 was 86 per 100,000 population, against 83.4 for 1920. In comparing the death rate from cancer in one State with that in another, the bureau uses "adjusted" rates in order to make allowance for differences in the age and the sex distribution of the population, because, generally speaking, only persons in middle life and old age have cancer, so that a State with many old persons may be expected to have more deaths from cancer than a State with comparatively few old persons.

The highest "adjusted" cancer rate for 1921 is 99.6 per 100,000 population for the State of Massachusetts, and the lowest is 47.6 for the State of South Carolina.

For a few States adjusted rates have been calculated separately for the white and colored population. In this group of States the highest adjusted cancer rate for the white population is 95.9 per 100,000 population for New York, and the highest rate for the colored population is 90.6, also for New York. The lowest adjusted cancer rate for the white population is 51.5, for Tennessee, and the lowest for the colored population is 36.4, for Florida.

Summarized briefly, the adjusted rates show that the Northern States have comparatively high and the Southern States comparatively low cancer mortality, and that there is little difference between the adjusted cancer rates of the white and colored races of the same States. In other words, the white and colored races seem equally susceptible to cancer, but both races seem less susceptible in the South than in the North.

‡ Not admitted to registration area until a later date.

## SMALLPOX IN OLDHAM AND LONDON, ENGLAND.<sup>1</sup>

An outbreak of smallpox, apparently introduced from Yorkshire, where there had been an epidemic of the disease, occurred in Oldham in the early part of 1922, the first case being notified to the public health department on February 7. A total of 54 cases occurred. The type was mild, and there were no deaths.

Vaccination histories of the patients, by age groups, were given as follows.

<sup>1</sup> The Medical Officer, Oct. 21, 1922, p. 181; Oct. 28, 1922, p. 192.

Age-group (years).	Vaccinated in infancy.	Unvaccinated.	Total number of cases.
0-5.....	0	5	5
5-10.....	0	8	8
10-15.....	0	9	9
15-20.....	0	6	6
20-30.....	0	4	4
30-40.....	3	5	8
40-50.....	6	0	6
50-60.....	5	0	5
Over 60.....	3	0	3
<b>Total.....</b>	<b>17</b>	<b>37</b>	<b>54</b>

The 54 cases occurred in 22 houses, in which there were 112 people altogether, 68 of the contacts escaping. The vaccination history of the 68 contacts who escaped was given as follows:

Vaccinated in infancy.....	29
Primarily vaccinated after contact.....	29
Successfully vaccinated 18 years ago.....	1
Vaccinated or revaccinated in army.....	5
Unsuccessfully vaccinated after contact.....	1
Refused revaccination.....	3

As stated, the infection appeared to be very mild as compared with previous outbreaks, and a fairly intimate contact was necessary before infection occurred.

In contrast to this mild type of the disease, there occurred in London, during the period July 26–October 13, 1922, 19 cases of smallpox, with five deaths—a case fatality of 28 per cent. These cases occurred in two groups of contacts, the original case in one group having been first diagnosed as chicken pox. Two of the original cases of the other group were discovered after they had nearly recovered from a mild attack, and only when a doctor was consulted in regard to the third patient, who died a few days subsequent to discovery.

Attention is called to the fact that unrecognized cases were responsible for both groups of cases, thus emphasizing the need for prompt recognition of the disease in the earliest possible stage.

The fatality rate of smallpox in London during this small outbreak presents a striking contrast to that in other parts of the country, where over 700 cases are stated to have occurred during the present year, of which only 1 has proved fatal.

The public health committee, in forwarding the report of the medical officer, Dr. W. H. Hamer, to the London county council, comments as follows:

“The danger of an epidemic of virulent smallpox in this country is, in our opinion, accentuated by the unvaccinated condition of a large proportion of the population, especially young persons. Since the passing of the vaccination act, 1898, which provided for exemption from compulsory vaccination of an infant on the production of a certificate of ‘conscientious’ objection by the parent, the number

of infants vaccinated throughout England and Wales has declined from 66.4 per cent of births in 1899 to 39.5 per cent in 1920. We are informed that in prevaccination days the incidence of fatality of smallpox fell chiefly upon young children, and in our view the accumulation within recent years of large numbers of young persons, deprived of the protection afforded by vaccination in infancy, might be fraught with grave consequences in the event of smallpox becoming prevalent."

### VACCINATION ORDINANCES UPHeld BY UNITED STATES SUPREME COURT.

The following is an opinion of the Supreme Court of the United States in a case <sup>1</sup> in which ordinances of the city of San Antonio, Tex., requiring vaccination of school children, were held to be valid.

Mr. Justice BRANDEIS delivered the opinion of the court.

Ordinances of the City of San Antonio, Tex., provide that no child or other person shall attend a public school or other place of education without having first presented a certificate of vaccination. Purporting to act under these ordinances, public officials excluded Rosalyn Zucht from a public school because she did not have the required certificate and refused to submit to vaccination. They also caused her to be excluded from a private school. Thereupon Rosalyn brought this suit against the officials in a court of the State. The bill charges that there was then no occasion for requiring vaccination; that the ordinances deprive plaintiff of her liberty without due process of law by, in effect, making vaccination compulsory; and, also, that they are void because they leave to the board of health discretion to determine when and under what circumstances the requirement shall be enforced without providing any rule by which that board is to be guided in its action and without providing any safeguards against partiality and oppression. The prayers were for an injunction against enforcing the ordinances, for a writ of mandamus to compel her admission to the public school, and for damages. A general demurrer to the bill of complaint was sustained by the trial court; and, plaintiff having declined to amend, the bill was dismissed. This judgment was affirmed by the court of civil appeals for the fourth supreme judicial district, 225 S. W. 267; a motion for rehearing was overruled, and an application for a writ of error to the Supreme Court of Texas was denied by that court. A petition for a writ of certiorari filed in this court was dismissed for failure to comply with rule 37, 257 U. S. 650. The case is now here on writ of error granted by the chief justice of the court of civil appeals. It is assigned as error that the ordinances violate the due process and equal protection clauses of the fourteenth amendment, and that as administered they denied to plaintiff equal protection of the laws.

The validity of the ordinances under the Federal Constitution was drawn in question by objections properly taken below. A city ordinance is a law of the State within the meaning of section 237 of the Judicial Code as amended, which provides a review by writ of error where the validity of a law is sustained by the highest court of the State in which a decision in the suit could be had. *Atlantic Coast Line v. Goldsboro*, 232 U. S. 548, 555. But although the validity of a law was formally drawn in question, it is our duty to decline jurisdiction whenever it appears that the constitutional question presented is not, and was not at the time of granting the writ, substantial in character. *Sugarman v. United States*, 249 U. S. 132, 184. Long before this suit was instituted, *Jacobson v. Massachusetts*, 197 U. S. 11, had settled that it is within the police power of a State to provide for compulsory vaccination. That case and others

<sup>1</sup> *Zucht v. King et al.*, decided Nov. 13, 1922.

had also settled that a State may, consistently with the Federal Constitution, delegate to a municipality authority to determine under what conditions health regulations shall become operative. *Laurel Hill Cemetery v. San Francisco*, 216 U. S. 358. And still others had settled that the municipality may vest in its officials broad discretion in matters affecting the application and enforcement of a health law. *Lieberman v. Van de Carr*, 199 U. S. 552. A long line of decisions by this court had also settled that in the exercise of the police power, reasonable classification may be freely applied and that regulation is not violative of the equal protection clause merely because it is not all embracing. *Adams v. Milwaukee*, 228 U. S. 572; *Miller v. Wilson*, 236 U. S. 373, 384. In view of these decisions we find in the record no question as to the validity of the ordinance sufficiently substantial to support the writ of error. Unlike *Yick Wo v. Hopkins*, 118 U. S. 356, these ordinances confer not arbitrary power, but only that broad discretion required for the protection of the public health.

The bill contains also averments to the effect that in administering the ordinance the officials have discriminated against the plaintiff in such a way as to deny to her equal protection of the laws. These averments do present a substantial constitutional question. *Neal v. Delaware*, 103 U. S. 370. But the question is not of that character which entitles a litigant to a review by this court on writ of error. The question does not go to the validity of the ordinance; nor does it go to the validity of the authority of the officials. Compare *United States v. Taft*, 203 U. S. 461; *Champion Lumber Co. v. Fisher*, 227 U. S. 445; *Yazoo & Mississippi Valley R. R. Co. v. Clarksdale*, 257 U. S. 10, 16. This charge is of an unconstitutional exercise of authority under an ordinance which is valid. Compare *Stadleman v. Miner*, 246 U. S. 544. Unless a case is otherwise properly here on writ of error, questions of that character can be reviewed by this court only on petition for a writ of certiorari.

Writ of error dismissed.

### SHIP FUMIGATION—CORRECTION TO PRELIMINARY REPORT OF BOARD OF INVESTIGATION.

The following corrections are made in the article "Ship fumigation—Preliminary report of the board," etc., that appeared in *Public Health Reports* for November 3, 1922:

Page 2746: Line 6 in the paragraph headed "Methods of production" should read, "Sulphuric acid, sodium cyanide, and salt," etc., and line 8 should read, "because of delayed time of lacrimation, danger from fire, and the predominance," etc. In the formula on this page, the specific gravity of commercial hydrochloric acid should be "1.15 to 1.20," and the amount of water should be 17 instead of 34 ounces.

Page 2747: In the seventh and twentieth lines, "hydrochloric acid gas" should read "hydrocyanic acid gas."

### DEATHS DURING WEEK ENDED NOVEMBER 11, 1922.

*Summary of information received by telegraph from industrial insurance companies for week ended November 11, 1922, and corresponding week 1921. (From the Weekly Health Index, November 14, 1922, issued by the Bureau of the Census, Department of Commerce.)*

	Week ended Nov. 11, 1922.	Corresponding week 1921.
Policies in force.....	51, 180, 358	47, 635, 423
Number of death claims.....	7, 523	6, 493
Death claims per 1,000 policies in force, annual rate.....	7. 7	7. 1

Deaths from all causes in certain large cities of the United States during the week ended November 11, 1922, infant mortality, annual death rate, and comparison with corresponding week of 1921. (From the Weekly Health Index, November 14, 1922, issued by the Bureau of the Census, Department of Commerce.)

City.	Estimated population July 1, 1922.	Week ended Nov. 11, 1922.		Annual death rate per 1,000, corresponding week 1921.	Deaths under 1 year.		Infant mortality rate, week ended Nov. 11, 1922. <sup>3</sup>

**SUMMARY OF CASES REPORTED MONTHLY BY STATES.**

The following summary of monthly State reports is published weekly and covers only those States from which reports are received during the current week:

State.	Cerebrospinal meningitis.	Diphtheria.	Influenza.	Malaria.	Measles.	Pellagra.	Poliomyelitis.	Scarlet fever.	Smallpox.	Typhoid fever.
<i>September, 1922.</i>										
Montana.....		29	1		4		9	34	14	39
New Mexico.....		89	2	2	1			23		83
North Dakota.....		34			3		2	33	7	6
<i>October, 1922.</i>										
Louisiana.....	2	109	34	120	2	4	4	21	14	65
Michigan.....	1,122			3	59		2	1,081	39	173
Montana.....	1	25	1		1		1	50	42	15
New Mexico.....		117		2	2			35		94
New York.....	20	1,488	163	53	463		159	1,126	42	302
North Dakota.....	1	90			3		4	87	42	31
West Virginia.....	5	477	19		37			344	20	168

**MALTA FEVER.**

Baltimore, Md.

One case of Malta fever was reported in Baltimore, Md., under date of November 16, 1922.

**CITY REPORTS FOR WEEK ENDED NOVEMBER 4, 1922.**

**CEREBROSPINAL MENINGITIS.**

The column headed "Median for previous years" gives the median number of cases reported during the corresponding weeks of the years 1915 to 1921, inclusive. In instances in which data for the full seven years are incomplete, the median is that for the number of years for which information is available.

City.	Median for previous years.	Week ended Nov. 4, 1922.		City.	Median for previous years.	Week ended Nov. 4, 1922.	
		Cases.	Deaths.			Cases.	Deaths.
