No. 44

THE NOTIFIABLE DISEASES

PREVALENCE DURING 1924 IN CITIES OF 10,000 TO 100,000 POPULATION

The tables shown on the following pages were compiled from data furnished by the health officers of cities. Requests for information were sent to all cities of the United States having 10,000 population or more. The data for cities having more than 100,000 population were published in the PUBLIC HEALTH REPORTS, volume 40, No. 36, September 4, 1925.

The following is a list of the diseases included:

Anthrax
Cerebrospinal meningitis
Chicken pox
Dengue
Diphtheria
Influenza
Lethargic encephalitis
Malaria
Measles
Mumps
Pellagra
Pneumonia (all forms)

Poliomyelitis (infantile paralysis)
Rabies in animals
Rabies in man
Rocky Mountain spotted fever
Scarlet fever
Septic sore throat
Smallpox
Tuberculosis (all forms and pulmonary)
Typhoid fever
Typhus fever
Whooping cough

The present article contains reports from cities having between 10,000 and 100,000 population. It is believed that practically all of these cities are included which have records of morbidity from communicable diseases which are of value for statistical purposes.

The estimated expectancy, given in the tables for some of the diseases, is the result of an attempt to ascertain from the experience of recent years how many cases of the disease under consideration might be expected in 1924. In most instances the estimated expectancy is the median number of cases reported by the city for the years 1917 to 1923, inclusive. When several epidemics have occurred during these years, or when for other reasons the median is not satisfactory, epidemic years are excluded, and the estimated expectancy is the mean of the number of cases reported for the nonepidemic years. The aim has been to ascertain how many cases of each disease may reasonably be expected in the absence of epidemics.

The column headed "Number of years" shows the number of years for which data are available for each city.

For all diseases except anthrax, lethargic encephalitis, rabies, Rocky Mountain spotted fever, and typhus fever there is given either the fatality rate per 100 cases or the number of cases reported for each death registered.

In comparing the figures for 1924 with the estimated expectancy or with averages for preceding years, it should be borne in mind that there has been a gradual improvement in the reporting of communicable diseases during the last few years. An increase in the number of cases reported may be due to better reporting of the particular disease rather than to an increase in the number of cases existing.

In studying these tables it should be kept in mind that a relatively large number of reported cases of a communicable disease as indicated by a high case rate (and more especially when accompanied by a relatively small number of deaths, as indicated by a low fatality rate) usually means that the health department of that city is active and that the cases of the disease are being well reported by the practicing physicians. It does not usually mean that the disease is more prevalent in that city than in other cities. A high fatality rate may mean that the disease was unusually virulent in a city, that the physicians did not treat the disease in that city with the success usual elsewhere, or that the practicing physicians did not report all of their cases to the health department. On the other hand, an unusually low fatality rate may be due to the fact that the disease in the city was unusually mild, that the physicians treated it with unusual success, that the practicing physicians reported their cases satisfactorily, or that the registration of deaths was incomplete or the assignment of the causes of death inaccurate.

Cities which did not report either cases or deaths of a certain disease in 1924 are not included in the table for that disease.

Reported Prevalence for the Year 1924

PLAGUE-ERADICATIVE MEASURES IN THE UNITED STATES

The following items were taken from the reports of plague-eradicative measures from the cities named:

Los Angeles, Calif.

Week ended Oct. 10, 1925:

Number of rats trapped.....	2, 787
Number of rats found to be plague infected.....	0
Number of squirrels examined.....	693
Number of squirrels found to be plague infected.....	0
Number of mice trapped.....	4, 393
Number of mice found to be plague infected.....	0

Date of discovery of last plague-infected rodent, Oct. 2, 1925.
 Date of last human case, Jan. 15, 1925.

Oakland, Calif.

(Including other East Bay communities)

Week ended Oct. 10, 1925:

Number of rats trapped.....	717
Number of rats found to be plague infected.....	0

Totals:

Number of rats trapped Jan. 1 to Oct. 10, 1925.....	70, 830
Number of rats found to be plague infected.....	21
Number of squirrels examined May 1 to Aug. 1, 1925.....	7, 277
Number of squirrels found to be plague infected.....	0

Date of discovery of last plague-infected rat, Mar. 4, 1925.
 Date of last human case, Sept. 10, 1919.

RECIPROCAL NOTIFICATIONS

Notifications regarding communicable diseases sent during the month of September, 1925, to other State health departments by departments of health of certain States

GENERAL CURRENT SUMMARY AND WEEKLY REPORTS FROM CITIES

Diphtheria.—For the week ended October 10, 1925, 36 States reported 1,619 cases of diphtheria. For the week ended October 11, 1924, the same States reported 1,922 cases of this disease. One hundred and two cities, situated in all parts of the country and having an aggregate population of about 23,000,000, reported 675 cases of diphtheria for the week ended October 10, 1925. Last year for the corresponding week they reported 770 cases. The estimated expectancy for these cities was 931 cases. The estimated expectancy is based on the experience of the last nine years, excluding epidemics.

Measles.—Thirty-three States reported 468 cases of measles for the week ended October 10, 1925, and 509 cases of this disease for the week ended October 11, 1924. One hundred and two cities reported 231 cases of measles for the week this year, and 113 cases last year.

Poliomyelitis.—The health officers of 36 States reported 215 cases of poliomyelitis for the week ended October 10, 1925. The same States reported 254 cases for the week ended October 11, 1924.

Scarlet fever.—Scarlet fever was reported for the week as follows: Thirty-six States—this year, 1,256 cases; last year, 1,900 cases. One hundred and two cities—this year, 497 cases; last year, 724 cases; estimated expectancy, 500 cases.

Smallpox.—For the week ended October 10, 1925, 36 States reported 92 cases of smallpox. Last year for the corresponding week they reported 242 cases. One hundred and two cities reported smallpox for the week as follows: 1925, 30 cases; 1924, 72 cases; estimated expectancy, 20 cases.

Typhoid fever.—One thousand and one cases of typhoid fever were reported for the week ended October 10, 1925, by 35 States. For the corresponding week of 1924, the same States reported 693 cases of this disease. One hundred and two cities reported 168 cases of typhoid fever for the week this year and 200 cases for the corresponding week last year. The estimated expectancy for these cities was 167 cases.

Influenza and pneumonia.—Deaths from influenza and pneumonia were reported by 102 cities for the week as follows: 1925, 296; 1924, 371.

City reports for week ended October 10, 1925

The "estimated expectancy" given for diphtheria, poliomyelitis, scarlet fever, smallpox, and typhoid fever is the result of an attempt to ascertain from previous occurrence how many cases of the disease under consideration may be expected to occur during a certain week in the absence of epidemics. It is based on reports to the Public Health Service during the past nine years. It is in most instances the median number of cases reported in the corresponding week of the preceding years. When the reports include several epidemics or when for other reasons the median is unsatisfactory, the epidemic periods are excluded and the estimated expectancy is the mean number of cases reported for the week during nonepidemic years.

If reports have not been received for the full nine years, data are used for as many years as possible, but no year earlier than 1915 is included. In obtaining the estimated expectancy, the figures are smoothed when necessary to avoid abrupt deviations from the usual trend. For some of the diseases given in the table the available data were not sufficient to make it practicable to compute the estimated expectancy.

¹ Dengue.—Savannah, Ga., 1 case, 1 death; Birmingham, Ala., 1 case.

The following table gives the rates per hundred thousand population for 104 cities for the 10-week period ended October 10, 1925. The population figures used in computing the rates were estimated as of July 1, 1923, as this is the latest date for which estimates are available. The 104 cities reporting cases had an estimated aggregate population of nearly 29,000,000, and the 96 cities reporting deaths had more than 28,000,000 population. The number of cities included in each group and the aggregate populations are shown in a separate table below.

Summary of weekly reports from cities, August 2 to October 10, 1925—Annual rates per 100,000 population¹
