## AUTOMOBILE FATALITIES, 1924

The Department of Commerce announces that the returns show that during the year 1924, 15,528 deaths resulting from accidents caused by automobiles and other motor vehicles (excluding motor cycles unless in collision with automobiles) occurred within the death registration area of the United States (exclusive of Hawaii), which area contains 88.4 per cent of the total population. This number represents a death rate of 15.7 per 100,000 population as against 14.9 in 1923, 12.5 in 1922, 11.5 in 1921 and 10.4 in 1920.

In the 34 States for which data for 1920 are available the actual number of these deaths increased from 8,828 in that year to 13,468 in 1923 and 14,437 in 1924, the corresponding rates for these three years being 10.3, 15.1, and 16.

The Bureau of the Census assigns the cause of death from collisions between two vehicles to the heavier vehicle; therefore these totals do not include collisions between automobiles and electric cars and railroad trains.

The Interstate Commerce Commission reports 1,688 deaths resulting from collisions between automobiles and railroad trains. Of this total, 1,532 occurred in registration States. However, in estimating the automobile fatalities this number should not be added to the 1924 State figures, for in all probability many reported to the Interstate Commerce Commission as collisions were reported to the Bureau of the Census as automobile accidents.

*Deaths and death rates in the registration area (exclusive of Hawaii), registration States, and 68 cities, from accidents caused by automobiles, motor trucks, and commercial motor vehicles: 1920 to 1924*

[Complete data not available to show how many of the deaths credited to any State or city occurred among the residents of that State or city or resulted from accidents which occurred in that State or city]

## AUTOMOBILE FATALITIES IN LARGE CITIES, JANUARY 1 TO NOVEMBER 7, 1925

The Department of Commerce announces that reports of automobile fatalities in 1925 have been received from 78 cities of 100,000 population or more. Forty of these cities show more automobile fatalities in the four-week period ending November 7 than in the previous four-week period. The following four cities show no fatalities for the last four weeks: Fall River, Norfolk, Spokane, and

Springfield, Mass. Somerville with 10 deaths so far for 1925 has the smallest number, but New Bedford with 12 deaths has the lowest rate (10.2) per 100,000 population.

For 59 cities with an aggregate population of 28,000,000, there were 4,511 automobile fatalities reported in the period January 1 to November 7, 1925, as contrasted with 4,345 such fatalities in the period January 1 to October 31, 1924. Of these 4,511 deaths 531, or 12 per cent, were reported in the four-week period ending November 7, 1925.

Of the 65 cities for which comparisons for 1924 and 1925 are possible so far, more than half (38) show more automobile fatalities reported in the period January 1 to November 7, 1925, than occurred in 10 months of 1924.

So far this year New York City has reported 831 automobile fatalities; Chicago 499, Philadelphia 261, Detroit 229, Los Angeles 190, Cleveland 184, while for the last four-week period the figures are: New York City 101, Chicago 46, Philadelphia 35, Detroit 29, Los Angeles 17, and Cleveland 11. Figures for the other cities are given in the table.

*Automobile fatalities reported January 1 to November 7, 1925. (Figures show deaths in each city, regardless of place of accident and regardless of residence)*

## CURRENT WORLD PREVALENCE OF DISEASE

REVIEW OF THE MONTHLY EPIDEMIOLOGICAL REPORT ISSUED OCTOBER 15, 1925,  
BY THE HEALTH SECTION OF THE LEAGUE OF NATIONS' SECRETARIAT<sup>1</sup>

The cholera outbreaks in Shanghai and Yokohama were practically at an end the last week in September, but in Manila a serious increase was reported with 137 cases in the two weeks from September 20 to October 3, according to the information in the October Epidemiological Report, published by the Health Section of the League of Nations' Secretariat. A report for Manila for the week ending October 10 shows a marked decline in the new cases of cholera. The weekly reports of cases of Cholera in these and other Asiatic ports reported to the Singapore Bureau during recent months are given in the table below:

*Cholera cases reported in the principal ports of the Far East, April 19–September 26, 1925*

Port	Report for week ended—														
	July			August						September				October

<sup>1</sup> Deaths only.

A report of an outbreak of cholera at Foochow, China, in September, has been received by the United States Public Health Service.<sup>2</sup> It was stated that 19 cases with 9 deaths were reported from September 6 to 19, and that the disease, though not epidemic, was unusually virulent in form.

Cholera in India continued to be much less prevalent during August than at the same season last year, and there was no sign as yet of an autumn epidemic. The total deaths reported for the whole of India in the four weeks ending August 15 numbered 4,109, as compared with 20,489 in the corresponding period of 1924.

*Plague.*—"A certain recrudescence" in a number of plague centers is noted by the Report, particularly in several African localities and

<sup>1</sup> From the Statistical Office, United States Public Health Service.

<sup>2</sup> Public Health Reports, Nov. 6, 1925, p. 2498.

Mediterranean ports. At Athens and Piræus, unofficial reports gave 16 cases of plague between August 2 and 14, and several cases during the remainder of August. Italy reported 2 cases, September 3-5, at Secondigliano, Province of Naples. On August 22, one case was found at Constantinople. In the first 3 weeks of September 2 cases were reported at Alexandria and 2 at Port Said.

Further information is given on the plague incidence in south-eastern Russia, where an outbreak which started during May had resulted in 121 cases with 86 deaths to July 26.<sup>1</sup> From July 27 to August 25, 28 cases and 3 deaths were reported in the Kalmuk Region; the Stalingrad Government reported 9 cases and 19 deaths from July 27 to August 16; the Cossack Republic notified 4 cases and 4 deaths July 30; and the district of Salsk in northern Caucasus notified 22 cases and 10 deaths between June 6 and August 28. No extension of the infected area is indicated since the report two months ago. To September 13 the health commissariat at Moscow had received reports of a total of 198 cases and 132 deaths.

The principal outbreaks of plague in Africa during recent months are shown in the table below:

*Plague cases in several African countries, June, July, and August, 1925*

Country	May	June	July	August
Kenya.....	100	414	29	57
Madagascar.....	71	40	23	54
Nigeria.....	7	0	21	.....
Senegal.....	63	17	119	31
	May 17 to June 13	June 14 to July 11	July 12 to Aug. 8	
Uganda.....	67	98	98	

"The weekly returns of plague from India show an increase since the beginning of July, the number of cases and deaths reported being higher than during the corresponding weeks of 1924," states the Report. The greatest increase is shown for the week ending August 22 (latest report available), when 1,385 cases were reported compared with 619 cases in the preceding week. The incidence is greatest in Burma, but Bombay Presidency, Mysore, and the United Provinces report more cases than last year.

*Yellow fever.*—New cases of yellow fever reported since last month's Report included 4 cases in Liberia the first week in August, and 2 cases in Nigeria—one in Kaduna August 5 and one in Ibadan in the week of August 9-15.

*Typhus fever.*—"The incidence of typhus has never been lower than this summer since the most favorable pre-war years; the number

<sup>1</sup> Epidemiological Report, Aug. 15, 1925, and Public Health Reports, Oct. 2, 1925.

of cases reported during each of the recent months exceeds 100 only in Russia, Poland, and Rumania and even in these instances amounts to less than half last year's figure," says the Report.

*Smallpox.*—Smallpox continues less prevalent than last year in most European countries. No case of smallpox was reported during the first eight months of the year in Ireland, Sweden, Finland, Austria, Czechoslovakia, or Bulgaria, and only a few in Scotland, Norway, Esthonia, the Netherlands, and Hungary.

In Tanganyika Territory a serious outbreak of smallpox was reported with 1,180 cases and 427 deaths notified during August, but many of them had occurred in the preceding two months.

*Dysentery.*—The incidence of dysentery increased during August and September in many European countries, and cases were reported in several countries where the disease is of rare occurrence. Thus, in Norway 194 cases were reported during August, whereas only 6 cases were reported in the same month of 1924; in Sweden 37 cases were reported in August and only 1 case in August, 1924. In the four weeks ending September 5 the Netherlands reported 82 cases, as compared with 13 in the month of August, 1924. In Germany the number of cases for the four weeks ending September 5 was slightly higher than for the same period last year, 1,234 as compared with 1,110, and increased from 822 in the preceding four-week period.

Dysentery was less prevalent during the past summer, however, in the countries east and southeast of Germany. In Poland 953 cases were reported in the four weeks ending August 22, as compared with 1,896 in the corresponding period of 1924. For August the Kingdom of the Serbs, Croats, and Slovenes reported 301 cases, as compared with 620 in four weeks ending August 30 last year.

The case fatality of dysentery in the countries south and east of Germany is nearly the same as the case fatality for enteric fever, as is indicated by the following table:

*Case fatality of dysentery and enteric fever in certain European countries, 1925*

Country	Period	Dysentery			Enteric fever		
		Cases	Deaths	Per cent	Cases	Deaths	Per cent
Austria.....	33 weeks.....	144	10	7.0	1,196	79	6.6
Czechoslovakia.....	7½ months.....	420	34	8.1	3,538	309	8.7
Poland.....	34 weeks.....	1,985	199	10.0	7,634	656	8.6
Kingdom of the Serbs, Croats, and Slovenes.....	8½ months.....	878	96	10.9	2,324	283	12.1
Hungary.....	7½ months.....	797	109	13.7	2,234	257	11.5

*Enteric fever.*—The seasonal increase in enteric fever continued in most European countries during August. In Norway and Sweden the summer maximum seems definitely to have been reached in June,

after which a marked drop in the cases occurred in July and August. Not much difference in the incidence this year and last is shown by the majority of countries.

*Lethargic encephalitis.*—In England and Wales a slight increase in cases of lethargic encephalitis occurred in September, the total notifications for the four weeks ending September 26 being 171, as compared with 154 the preceding four weeks. "For the first time since February the incidence approaches last year's level."

For the most part the countries which report this disease currently have reported only sporadic cases in recent months, with no indication of an increased incidence.

*Acute poliomyelitis.*—Although in some countries marked increases in the incidence of poliomyelitis occurred during August, no serious epidemics are indicated. The greatest increases were shown by the returns for Norway, Sweden, Denmark, Germany, France, and Italy.

*Cases of poliomyelitis reported in various countries, 1924-25*

<sup>1</sup> 27 States of the United States.

<sup>2</sup> Three weeks.

*Tuberculosis.*—An interesting comparison between the tuberculosis death rates for the first half of 1925 and the first half of 1924 in many of the larger cities and towns of the world, but especially of Europe, is given in the report. A marked reduction in 1925 from 1924 is shown by nearly all the cities of Europe, varying from about 6 per cent in London, Glasgow, and Dublin to 20 per cent in Prague, 22

per cent in Lodz, 25 per cent in Breslau, and 33 per cent in Budapest. The rates for Paris, Amsterdam, and the Swiss cities were the same in the two years. Practically all cities outside of Europe show a definite increase in the tuberculosis mortality in the first half of 1925 as compared with the first half of 1924.

MORTALITY FROM TUBERCULOSIS (ALL FORMS) IN 46 GERMAN CITIES AND IN LONDON, BY FOUR-WEEKLY PERIODS, 1921-1925.

The continued downward trend in Germany in the mortality from tuberculosis is shown in the accompanying graph. The level now corresponds with that in London and the seasonal fluctuations in the mortality are less marked than formerly.

*Leprosy.*—Data on the prevalence of leprosy is given in the following table:

*New cases of leprosy reported in various countries during 1924 and by quarters in 1925*

<sup>6</sup>Deaths for week ended Friday, Nov. 27, 1925.

<sup>7</sup>In the cities for which deaths are shown by color, the colored population in 1920 constituted the following per cents of the total population: Atlanta 31, Baltimore 15, Birmingham 39, Dallas 15, Fort Worth 14, Houston 25, Kansas City, Kans., 14, Louisville 17, Memphis 38, Nashville 30, New Orleans 26, Norfolk 38, Richmond 32, and Washington, D. C., 25.

# PREVALENCE OF DISEASE

*No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring*

## UNITED STATES

### CURRENT WEEKLY STATE REPORTS

These reports are preliminary and the figures are subject to change when later returns are received by the State health officers

## PLAGUE-ERADICATIVE MEASURES IN THE UNITED STATES

The following items were taken from the reports of plague-eradica-  
tive measures from the cities named:

*Los Angeles, Calif.*

Week ended Nov. 21, 1925:

Number of rats trapped.....	1,895
Number of rats found to be plague infected.....	0
Number of squirrels examined.....	388
Number of squirrels to be plague infected.....	0
Number of mice trapped.....	3,600
Number of mice found to be plague infected.....	0

Date of discovery of last plague-infected rodent Nov. 6, 1925.

Date of last human case, Jan. 15, 1925.

## Oakland, Calif.

(Including other East Bay communities)

Week ended Nov. 21, 1925:	
Number of rats trapped.....	712
Number of rats found to be plague infected.....	0
Totals:	
Number of rats trapped Jan. 1 to Nov. 21, 1925.....	75, 997
Number of rats found to be plague infected.....	21
Number of squirrels examined May 1 to Aug. 1, 1925.....	7, 277
Number of squirrels found to be plague infected.....	0
Number of mice trapped Jan. 1 to Nov. 21, 1925.....	27, 318
Date of discovery of last plague-infected rat, Mar. 4, 1925.	
Date of last human case, Sept. 10, 1919.	

**GENERAL CURRENT SUMMARY AND WEEKLY REPORTS FROM CITIES**

*Diphtheria.*—For the week ended November 21, 1925, 37 States reported 1,881 cases of diphtheria. For the week ended November 22, 1924, the same States reported 2,160 cases of this disease. Ninety-eight cities, situated in all parts of the country and having an aggregate population of more than 28,800,000, reported 996 cases of diphtheria for the week ended November 21, 1925. Last year for the corresponding week they reported 1,112 cases. The estimated expectancy for these cities was 1,439 cases. The estimated expectancy is based on the experience of the last nine years, excluding epidemics.

*Measles.*—Thirty-four States reported 2,890 cases of measles for the week ended November 21, 1925, and 860 cases of this disease for the week ended November 22, 1924. Ninety-eight cities reported 1,274 cases of measles for the week this year and 399 cases last year.

*Poliomyelitis.*—The health officers of 37 States reported 64 cases of poliomyelitis for the week ended November 21, 1925. The same States reported 97 cases for the week ended November 22, 1924.

*Scarlet fever.*—Scarlet fever was reported for the week as follows: Thirty-seven States—this year, 2,905 cases; last year, 2,833 cases. Ninety-eight cities—this year, 1,015 cases; last year, 1,227 cases; estimated expectancy, 884 cases.

*Smallpox.*—For the week ended November 21, 1925, 37 States reported 279 cases of smallpox. Last year for the corresponding week they reported 606 cases. Ninety-eight cities reported smallpox for the week as follows: 1925, 93 cases; 1924, 183 cases, estimated expectancy, 39 cases. One death from smallpox was reported by these cities for the week—at Los Angeles, Calif.

*Typhoid fever.*—Five hundred and thirty-nine cases of typhoid fever were reported for the week ended November 21, 1925, by 36 States. For the corresponding week of 1924, the same States reported 539 cases of this disease. Ninety-eight cities reported 95

cases of typhoid fever for the week this year and 132 cases for the corresponding week last year. The estimated expectancy for these cities was 98 cases.

*Influenza and pneumonia.*—Deaths from influenza and pneumonia were reported for the week by 91 cities, with a population of more than 28,000,000, as follows: 1925, 862 deaths; 1924, 681.

*City reports for week ended November 21, 1925*

The "estimated expectancy" given for diphtheria, poliomyelitis, scarlet fever, smallpox, and typhoid fever is the result of an attempt to ascertain from previous occurrence how many cases of the disease under consideration may be expected to occur during a certain week in the absence of epidemics. It is based on reports to the Public Health Service during the past nine years. It is in most instances the median number of cases reported in the corresponding week of the preceding years. When the reports include several epidemics or when for other reasons the median is unsatisfactory, the epidemic periods are excluded and the estimated expectancy is the mean number of cases reported for the week during nonepidemic years.

If reports have not been received for the full nine years, data are used for as many years as possible, but no year earlier than 1915 is included. In obtaining the estimated expectancy, the figures are smoothed when necessary to avoid abrupt deviations from the usual trend. For some of the diseases given in the table the available data were not sufficient to make it practicable to compute the estimated expectancy.

<sup>1</sup> Typhus fever—1 case, New York City.

The following table gives the rates per 100,000 population for 103 cities for the 10-week period ended November 21, 1925. The population figures used in computing the rates were estimated as of July 1, 1923, as this is the latest date for which estimates are available. The 103 cities reporting cases had an estimated aggregate population of nearly 29,000,000, and the 96 cities reporting deaths

had more than 28,000,000 population. The number of cities included in each group and the aggregate populations are shown in a separate table below.

Summary of weekly reports from cities, September 13 to November 21, 1925—Annual rates per 100,000 population<sup>1</sup>
