### **PUBLIC HEALTH REPORTS**

VOL. 47

#### MAY 20, 1932

NO. 21

#### CURRENT PREVALENCE OF COMMUNICABLE DISEASES IN THE UNITED STATES <sup>1</sup>

#### March 27-April 23, 1932

The prevalence of certain important communicable diseases, as indicated by weekly telegraphic reports from State health departments to the Public Health Service, is summarized in this report. The underlying statistical data are published weekly in the Public Health Reports, under the section entitled "Prevalence of Disease."

Influenza.--For the four weeks ended April 23 there were 21,742 cases of influenza reported, approximately 15,000 less than were reported for the preceding 4-week period. Compared with preceding years the current figure was 1.8 times the figure for the same period in 1931, 3.3 times the figure in 1930, and 3.9 times the number of cases reported in 1929. In four of the six geographic areas the current incidence was considerably in excess of the incidence reported for the same period in the three preceding years. In the West North Central States the number of cases reported represented only about 85 per cent of the number reported for the same period last year, but it was twice the number reported in 1930 and 1.4 times the num-The Mountain and Pacific States reported a decrease ber in 1929. in the number of cases from last year's figure of about 45 per cent. It was, however, 2.6 times the number reported in 1930 and very closely approximated the figure for 1929. The peak has apparently been passed in all sections of the country. While in the South Atlantic States an increase of approximately 2,000 cases over the preceding 4-week period was reported for the current period, the peak was reached during the week ended April 9, several weeks later than in any other geographic area, and the following 2-week period showed a considerable decline in the number of cases.

Typhoid fever.—During the current 4-week period 664 cases of typhoid fever were reported, a figure approximately 30 per cent in excess of last year's figure for the same period. While the figure

<sup>&</sup>lt;sup>1</sup> From the Office of Statistical Investigations, U. S. Public Health Service. The numbers of States included for the various diseases are as follows: Typhoid fever, 47; poliomyelitis, 48; meningococcus meningitis, 48; smallpox, 48; measles, 45; diphtheria, 47; scarlet fever, 47; influenza, 39 States and New York City. The District of Columbia is counted as a State in these reports.

was in excess of that for last year, it closely approximated the incidence for the same period in 1930, and represented a decrease of approximately 17 per cent from the incidence for the corresponding period of 1929. All areas except the New England and Middle Atlantic, where the incidence was the lowest in four years, contributed to the increase over last year. The disease seemed to be most prevalent in the South Atlantic and South Central States.

Scarlet fever.—The reported current incidence (24,560 cases) of scarlet fever was about 11 per cent in excess of that of last year. This excess was attributable to an increase in the number of cases reported in the New England and Middle Atlantic States, where the disease has been unusually prevalent for several months. All other areas either approximated last year's incidence or showed decreases ranging from 10 per cent in the South Atlantic States to 40 per cent in the West North Central States. For this period in 1930 and 1929 the cases totaled 19,664 and 20,428, respectively.

Diphtheria.—For the country as a whole the current diphtheria incidence (3,248 cases) was the lowest for this 4-week period in four years. A comparison of geographic areas shows that a similar situation existed in the New England and Middle Atlantic, East and West North Central, and South Atlantic States, while in the Mountain and Pacific and South Central States the incidence was the highest in four years. The usual seasonal decline, however, was apparent in all areas.

Measles.—The number of cases of measles reported for the 4-week period ended April 23 was 61,868. This was approximately 12,500 more than were reported for the preceding 4-week period, but represented only a normal increase for this season of the year. For this same period in the years 1931, 1930, and 1929 the number of cases totaled 80,856, 68,364, and 56,995, respectively. A comparison of geographic areas shows that only one area, the East North Central, reported a larger number of cases during the current period than were reported for the corresponding four weeks of last year.

Smallpox.—For smallpox the comparison of the incidence for the current period with that for the same period in previous years continued very favorable. The number of cases reported (1,530) was only 38 per cent, 24 per cent, and 37 per cent of the cases reported for the corresponding period in the years 1931, 1930, and 1929, respectively. All geographic areas, except the New England and Middle Atlantic States, showed smaller numbers of cases as compared with the preceding three years. In the excepted group the number of cases (41) was 2.6 times the number reported for the same period last year. Of the total number reported, 15 cases occurred in Vermont and 25 in New York. In 1930, this group of States reported 37 cases for this period, and in 1929 the number of cases totaled 74. Meningococcus meningitis.—The New England and Middle Atlantie and East North Central areas seemed mostly responsible for a rather sharp upward turn in the incidence of meningococcus meningitis during the four weeks ended April 23. In the former group the number of cases increased from 70 during the four weeks ended March 26 to 102 during the current period, and in the latter group the number increased from 96 to 113. Compared with previous years, however, these regions, with all others, still maintained a satisfactory low level, the incidence being the lowest in four years

in all regions except the South Atlantic.

Poliomyelitis.—The incidence of poliomyelitis for the current period was slightly below the incidence for the same period last year, but was about 20 per cent in excess of the incidence reported in the same period in 1930 and 1929. The cases (79) reported for the four weeks ended April 23 were distributed among the various geographic areas as follows: New England and Middle Atlantic, 22 cases; South Atlantic, 7 cases; East North Central, 17 cases; West North Central, 7 cases; South Central, 10 cases; and Mountain and Pacific, 16 cases. Mortality, all causes.—The average mortality rate from all causes in large cities, as reported by the Bureau of the Census, dropped from 13.5 per thousand population (annual basis) for the four weeks ended March 26, to 12.5 for the current 4-week period. The current rate was approximately the same as that for the corresponding period in 1931, but was considerably below the average rate (13.8) for the years 1927 to 1930, inclusive.

#### COMPARISON OF TRACHOMA VIRULENCE IN DIFFERENT SECTIONS OF THE UNITED STATES

By C. E. RICE, Passed Assistant Surgeon, J. E. SMITH, Acting Assistant Surgeon, and ROBERT SORY, Acting Assistant Surgeon, United States Public Health Service

The question of virulence in trachoma has never received the attention it deserves. In reports on the prevalence of trachoma in different localities and among different races, there is usually no mention made by authors of the amount of damage done by the disease. The mere statement that a certain percentage of the people in a particular area have trachoma has usually been considered all that is necessary.

The virulence of trachoma can not be measured by the number of fatalities. The index of trachoma virulence is based, first, on the amount of blindness (light perception or less) caused by trachoma, and, second, on the number of cases observed with distorted lids and resulting entropion. The blindness here considered is recorded as so many blind eyes. A case with blindness in each eye is recorded as two blind eyes, and one with blindness in only one eye is recorded as one blind eye. In considering entropion, no separation is made of the cases with entropion in both eyes and those with entropion in only one eye.

It has been noted by officers of the United States Public Health Service engaged in trachoma eradication work that there is considerable difference in the amount of damage caused by trachoma in the different sections of the country where their work has been conducted. This study is an endeavor to determine whether this is actually the case.

The data supplied by the different medical officers in charge of trachoma control measures of the United States Public Health Service, and published in the annual reports of the Surgeon General, have been utilized in this study.

The total number of cases reported in each of the six areas, except Georgia, refers to the cases passing through the dispensaries of the many temporary field hospitals that were established in the different infected areas during the first six years of trachoma work in each area. The 708 cases reported in Georgia comprise the total number of cases seen in that area in 1931. The areas are arranged in order of degree of virulence.

State	Number of cases	Number of entropions to each 100 cases of trachoma	
Missouri	1, 609	43. 4	8.2
Arkansas	1, 037	29. 7	7.4
Kentucky	5, 846	10. 8	5.8
Tennessee	1, 825	6. 1	1.2
South Georgia	708	1. 1	.28

While the economic status of the people living in these different trachoma regions is very much the same, there are minor differences in the dietary habits. No reason can be advanced as to why there should be this difference.

#### CONCLUSION

Analysis of the collected data indicates a marked difference in the virulence of trachoma in different sections of the United States, as measured by the frequency of entropion and blindness caused by this disease.

#### DEATH RATES IN A GROUP OF INSURED PERSONS

#### RATES FOR PRINCIPAL CAUSES OF DEATH FOR MARCH, 1932

The accompanying table is taken from the Statistical Bulletin for April, 1932, issued by the Metropolitan Life Insurance Co., and presents the mortality record of the industrial insurance department of the company for March, 1932, as compared with that for the preceding month and for March, 1931. It also presents a comparison of the cumulative death rates for January-March for the two years. The rates in this group of insured persons in recent years are based on numbers varying between 17,000,000 and 19,000,000. The annual general death rate for this group in the past few years has averaged about 72 per cent of the death rate for the registration area of the United States.

Although the death rate for these policyholders for March, 1932, rose sharply from that for February and was also slightly higher than the rate for March of last year, the cumulative rate for the three-month period January-March was lower this year than it was in 1931.

The Bulletin states:

The death rate of the industrial policyholders rose sharply, in March, to 10.4 per thousand, as compared with 8.8 in February. The March mortality rate was nevertheless well below the average for that month during the last 10 years. Among insured Canadians, in fact, the March death rate was lower than in 1931; but throughout the United States an increase was in evidence.

Increased mortality in March, as compared with February, was observed for every cause of death listed in the table, except typhoid fever, diphtheria, diarrheal diseases, puerperal conditions, suicides, and homicides. Comparison with March a year ago shows marked drops for influenza, tuberculosis, and pneumonia, which were slightly more than counterbalanced by increases for several other important causes of death.

All other causes	15.8 216.5	15.7 194.5	16. 4 218. 6	18.4 197.1	18.4 206.6	

• All figures in this table include insured infants under one year of age. The rates for 1932 are subject to slight correction, since they are based on provisional estimates of lives exposed to risk.

#### COURT DECISION RELATING TO PUBLIC HEALTH

City held liable for sewage pollution of stream.—(Oklahoma Supreme Court; Oklahoma City v. West, 7 P. (2d) 888; decided Nov. 10, 1931.) In an action brought by a riparian owner against a city to recover damages resulting from the discharge of unpurified sewage into a stream, the judgment was in favor of the plaintiff. Certain points decided by the supreme court are well set forth in the official syllabi prepared by the court, and those portions of such syllabi which are of interest from a public health standpoint are as follows:

In a suit to recover damages caused by the discharge of unpurified sewage into a water course to the damage of a riparian owner, a contention that, since a sewer system is a permanent structure, in the absence of an allegation of negligence in the adoption of the plan of construction of the sewer system or in a failure to construct the system in accordance with the plan adopted, the nuisance should be considered permanent, is unsound, for the damages in such case are not caused by the so-called permanent structure but by the manner of its use. City of Mangum v. Sun Set Field, 73 Okl. 11, 174 P. 501, to the contrary, is overruled.

Judicial notice is taken of the fact that sewage can be easily and successfully purified by the use of modern appliances, so that a nuisance, caused by the discharge of unpurified sewage into a water course, is, as has heretofore been declared by this court, a temporary nuisance within the rule that a nuisance is temporary that can be abated by the expenditure of money or labor.

Where work is required or authorized by the legislature and a nuisance is not the necessary result of the performance of the work, it can not be contended that the nuisance is legalized and that the right to recover damages for the nuisance is based upon a constitutional provision that private property shall not be taken or damaged for public use without just compensation, but the damages are recoverable for a common law tort which has not been legalized, and, if the commission of the nuisance is unnecessary, it is unnecessary to allege that there was negligence in the adoption of the plan for the work or in the construction of the work in accordance with the plan adopted, as the burden of showing necessity is upon the defendant, and an allegation that the nuisance can be abated by the expenditure of money or labor indicates that the commission of the nuisance was unnecessary and that its continuation is unnecessary.

It is not within the power of a municipality, guilty of the commission of a nuisance by discharging unpurified sewage into a water course to the damage of a riparian owner, to elect to continue the nuisance and require the nuisance to be held to be permanent. An indication to the contrary in Page v. Oklahoma City, 129 Okl. 28, 263 P. 448, is disapproved.

#### DEATHS DURING WEEK ENDED APRIL 30, 1932

Summary of information received by telegraph from industrial insurance companies for the week ended April 30, 1932, and corresponding week of 1931. (From the Weekly Health Index, issued by the Bureau of the Census, Department of Commerce)

Deaths of nonresidents are included. Stillbirths are excluded.
 These rates represent annual rates per 1,000 population, as estimated for 1932 and 1931 by the arithmetical

a Deaths under 1 year of age per 1,000 estimated live births. Cities left blank are not in the registration

Deaths under 1 year of age per 1,000 estimated into Enter.
area for births.
Data for 80 cities.
Deaths for week ended Friday.
For the cities for which deaths are shown by color the percentages of colored population in 1930 were as follows: Atlanta, 33; Baltimore, 18; Birmingham, 38; Dallas, 17; Fort Worth, 16; Houston, 27; Indianapolis, 12; Kansas City, Kans., 19; Knoxville, 16; Louisville, 15; Memphis, 38; Miami, 23; Nashville, 28; New Orleans, 29; Richmond, 29; Tampa, 21; and Washington, D. C., 27.
Population Apr. 1, 1930; decreased 1920 to 1930, no estimate made.

#### **PREVALENCE OF DISEASE**

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring

#### UNITED STATES

#### **CURRENT WEEKLY STATE REPORTS**

These reports are preliminary, and the figures are subject to change when later returns are received by the State health officers

#### PATIENTS IN INSTITUTIONS FOR FEEBLE-MINDED, JULY-SEPTEMBER, 1930

Reports for the third quarter of the year 1930 were received by the Public Health Service from 35 institutions for the care of the feebleminded, located in 28 States and the Territory of Hawaii. The total number of persons in these institutions on September 30, 1930, including those on temporary leave or otherwise absent but still on the books, was 40,529.

The first admissions were as follows:

	Male	Female	Total
July	213 233 254	201 197 216	414 430 470
Total	700	614	1, 314

Of the first admissions during the three months, 53.3 per cent were males and 46.7 per cent females, the ratio being 114 males per 100 females.

One hundred and twenty-four male patients and 97 female patients died during the three months. The annual death rates, based on the number of patients on the books September 30, 1930, were males, 23.7 per 1,000; females, 19.4 per 1,000; persons, 21.6 per 1,000. Three hundred and eighteen male patients and 198 female patients were discharged during the three months.

The following table shows the number of patients in the institutions and on temporary leave on July 1, 1930, and at the end of each month of the third quarter of 1930, and the percentages of the total number of patients who were on leave.

	July 1, 1930	July 31, 1930	Aug. 31, 1930	Sept. 30, 1930
Patients in institutions: Male Female	16, 894 16, 962	16, 752 16, 919	17, 029 17, 128	17, 391 17, 415
Total	33, 856	33, 671	34, 157	34, 806
Patients on temporary leave: Male Female	3, 593 2, 488	3, 710 2, 628	3, 535 2, 511	3, 348 2, 375

#### GENERAL CURRENT SUMMARY AND WEEKLY REPORTS FROM CITIES

The 90 cities reporting cases used in the following table are situated in all parts of the country and have an estimated aggregate population of more than 31,325,000. The estimated population of the 83 cities reporting deaths is more than 29,770,000. The estimated expectancy is based on the experience of the last nine years, excluding epidemics.

Weeks ended April 30, 1932, and May 2, 1951

#### City reports for week ended April 30, 1932

The "estimated expectancy" given for diphtheria, poliomyelitis, scarlet fever, smallpox, and typhold fever is the result of an attempt to ascertain from previous occurrence the number of cases of the disease under consideration that may be expected to occur during a certain week in the absence of epidemics. It is based on reports to the Public Health Service during the past nine years. It is in most instances the median number of cases reported in the corresponding weeks of the preceding years. When the reports include several epidemics, or when for other reasons the median is unsatisfactory, the epidemic periods are excluded, and the estimated expectancy is the mean number of cases reported for the week during nonepidemic years.

If the reports have not been received for the full nine years, data are used for as many years as possible, but no year earlier than 1923 is included. In obtaining the estimated expectancy, the figures are smoothed when necessary to avoid abrupt deviation from the usual trend. For some of the diseases given in the table the available data were not sufficient to make it practicable to compute the estimated expectancy.

#### City reports for week ended April 30, 1932-Continued

.

<sup>1</sup> Typhus fever, 2 cases: 1 case at Savannah, Ga., and 1 case at Tampa, Fla.

May	20.	1932

The following table gives the rates per 100,000 population for 98 cities for the 5-week period ended April 30, 1932, compared with those for a like period ended May 2, 1931. The population figures used in computing the rates are estimated mid-year populations for 1931 and 1932, respectively, derived from the 1930 census. The 98 cities reporting cases have an estimated aggregate population of more than 34,000,000. The 91 cities reporting deaths have more than 32,400,-600 estimated population.

Summary of weekly reports from cities, March 27 to April 30, 1932—Annual rates per 100,000 population, compared with rates for the corresponding period of 1931<sup>1</sup>
