AUGUST 5, 1932

NO. 32

CURRENT PREVALENCE OF COMMUNICABLE DISEASES IN THE UNITED STATES¹

June 19-July 16, 1932

The prevalence of certain important communicable diseases, as indicated by weekly telegraphic reports from State health departments to the United States Public Health Service, is summarized in this report. The underlying statistical data are published weekly in the Public Health Reports, under the section entitled "Prevalence of Disease."

Poliomyelitis.—As compared with the preceding 4-week period the number of cases of poliomyelitis reported for the current four weeks increased in the various regions as follows: New England and Middle Atlantic, from 27 to 47 cases; East North Central, from 26 to 30; West North Central, from 5 to 23; South Central, from 20 to 29; and Mountain and Pacific, from 14 to 28. One region, the South Atlantic, reported the same number of cases as for the preceding period. For the entire reporting area the number of cases totaled 173, about 60 per cent of the number reported for the same period last year, and less than 30 per cent of the number in 1930. For this period in 1929, a more nearly normal year, 132 cases were reported. Of the six geographic areas, only two reported an excess over last year.

Typhoid fever.—The number of cases of typhoid fever reported during the current 4-week period was more than twice the number reported for the preceding four weeks. Comparison with previous years shows that the incidence was the highest for the same period in four years. The number of cases was 2,814, as compared with 2,302, 2,092, and 2,047 for the same period in 1931, 1930, and 1929, respectively. Two geographic areas, the East North Central and South Central groups, seemed to be mostly responsible for the increase. In each of those groups an excess in the number of cases over last year of approximately 60 per cent was reported. The

¹ From the Office of Statistical Investigations, U. S. Public Health Service. The numbers of States included for the various diseases are as follows: Typhoid fever, 47; poliomyelitis, 48; meningococcus meningitis, 48; smallpox, 48; measles, 45; diphtheria, 47; scarlet fever, 47; influenza, 39 States and New York City. The District of Columbia is counted as a State in these reports.

incidence was also the highest in four years in each group. The other four areas reported decreases from last year's figure. The Mountain and Pacific reported the lowest incidence in four years.

Measles.—The measles incidence continued at about an average level during the current 4-week period. The reported cases totaled 26,835. With one exception, the East North Central, all geographic areas reported fewer numbers of cases than were reported for the same period last year. The number of cases (10,438) reported from the East North Central States was less than one-half the number reported for the preceding 4-week period. It was, however, one and four-tenths times the number reported in 1931 for this period, and one and nine-tenths times the figure for 1930. It closely approximated the number in 1929. For several months this area has reported the highest incidence of measles in four years.

Diphtheria.—There was very little change in the incidence of diphtheria in the various geographic areas during the current period, but the general trend was downward. For the country as a whole, the cases numbered 2,071, which was approximately 400, 1,000, and 1,400 less than were reported for the same period in 1931, 1930, and 1929, respectively. For the past five months the incidence of diphtheria has been the lowest in four years.

Scarlet fever.—The number of cases of scarlet fever (7,538) reported for the 4 weeks ended July 16 was less than 50 per cent of the number reported for the preceding 4-week period. In relation to preceding years, however, the incidence was the highest for this period in four years. The New England and Middle Atlantic States seem mostly responsible for this situation. For more than a year and a half scarlet fever has been unusually prevalent in that region. For the current period, 4,007 cases were reported, as compared with 3,141, 2,162, and 2,137 for the same period in the years 1931, 1930, and 1929, respectively. In all other regions, the incidence compares very favorably with preceding years.

Meningococcus meningitis.—Since the beginning of the current year, the country as a whole has maintained the lowest incidence of meningococcus meningitis in four years. The number of cases reported (141) for the 4 weeks ended July 16 was only about 58 per cent of last year's figure for the corresponding period. For this same period in 1930 and 1929 the number of cases was 347 and 610, respectively. A comparison of geographic areas shows that the situation in practically all areas was similar to that described for the country as a whole.

Smallpox.—The current reported incidence of smallpox (482 cases) was only about 29 per cent of last year's figure for the same period. All regions shared in this favorable situation. In fact, for the country as a whole and for each geographic area, except the New England and Middle Atlantic, the incidence for the current period continued

to be the lowest in four years. In the New England and Middle Atlantic group of States New York reported 15 cases for the current period, as against 1 case for the preceding 4-week period, and Vermont reported 3 cases as compared with 12 for the preceding period. The total number of cases (18) was only 13 per cent of the cases reported for the same period in 1931, and 30 per cent of the number in 1930, but it was twice the number reported in 1929.

Influenza.—The reported number of cases of influenza for the current 4-week period was 1,282, as compared with 765, 856, and 962 for the same period in the years 1931, 1930, and 1929, respectively. While the number of cases in any area was not large, each area, except the New England and Middle Atlantic, reported a larger number of cases than was reported for the same period last year. In fact, in the New England and Middle Atlantic States the incidence for this period was the lowest in four years, while in the other areas it was the highest in that many years.

Mortality, all causes.—The mortality in a group of large cities reporting to the Bureau of the Census averaged 10 per thousand population (annual basis) for the 4-week period ended July 16, as compared with 11.2 for the corresponding period last year. The average rate for this period for the preceding six years is 11.3.

MORTALITY IN THE UNITED STATES REGISTRATION AREA, 1930

The Department of Commerce announces that in the United States death registration area in 1930 there were 1,343,356 deaths, with a rate of 1,133.1 per 100,000 population. The number of deaths and the death rate per 100,000 for 1929 were 1,386,363 and 1,191.9, respectively. These rates are based on estimated populations of 118,560,800 in 1930 and 116,317,515 in 1929. The death registration area in 1930 comprised about 96.2 % of the total population.

The decrease, as compared with 1929, in the mortality for the whole registration area of the United States is caused almost entirely by the great reduction in the number of deaths from influenza, from 64,853 in 1929 to 23,066 in 1930, for which respective rates were 55.5 and 19.5 per 100,000 population, and pneumonia (all forms), from 106,597 to 98,657, the rates for which were 91.6 and 83.2. Whooping cough and diphtheria also decreased quite markedly, the former from 7,310 to 5,707 deaths and the rate from 6.3 to 4.8, while the latter decreased from 7,685 to 5,822 deaths, and the rates from 6.6 to 4.9.

The only marked increases were caused by diseases of the heart, the number of deaths from which increased from 245,244 in 1929 to 253,084 in 1930 and the death rate from 210.8 to 213.5 per 100,000

population, and cancer and other malignant tumors, the deaths from which increased 111,569 in 1929 to 115,265 in 1930 and the death rate from 95.9 to 97.2.

The number of deaths and the death rates per 100,000 estimated population from principal causes of death are shown for 1929 and 1930 in the accompanying table.

Deaths and death rates in the United States registration area, 1930 and 1929

STATISTICS IN THE BIRTH REGISTRATION AREA, 1930¹**

The Department of Commerce announces that in 1930 there were 2,203,958 live births in the United States birth registration area. This area had, on July 1, 1930, an estimated population of 116,644,000, or 94.7 per cent of the estimated total population of the United States. The birth rate, therefore, was 18.9 per 1,000 estimated population. In the same area, for the same period, there were 1,321,367 deaths, representing a death rate of 11.3. With no change in the birth registration area in the two years, the increase in the total number of births in 1930 over 1929 was 34,038.

There is much variation in the birth rates of the different States. New Mexico leads with a rate of 28.5, followed by Utah (25.4), North Carolina (24.1), Alabama and West Virginia, 24.0 each; at the other extreme are Oregon (14.1), Nevada (14.6), California (14.7), and Washington (14.7).

The highest death rates are those for New Mexico (15.5) and Arizona (15.2); the lowest rates are those for North Dakota (7.9), Oklahoma (8.2), Wyoming (9.2), Idaho (9.4), and Nebraska (9.6).

¹ Provisional figures for the birth registration area exclusive of Utah were published in the Public Health Reports for Oct. 2, 1931, pp. 2373-2376.

For the birth registration area as a whole, the birth rate for the white population is 18.7, colored, 20.7; death rates, white, 10.8, colored, 15.6. In some States the order of the birth rates for the two races is the reverse of that shown for the registration area as a whole. In Arkansas, for example, the rate for the white is 23.2 and for the colored 18.9; in Kentucky, for the white, 23.4, for the colored, 15.0; in Oklahoma, for the white, 18.4, for the colored, 11.8; and in Tennessee, for the white, 20.8, for the colored, 17.0.

Marked contrasts are shown in the death rates for the white and those for the colored in all of the States having large colored populations. In Kentucky, for example, the death rate for the white was 10.4 and for the colored 21.0. Other States showing contrasts are as follows: Tennessee, white, 9.9, colored, 18.3; Virginia, 10.5 and 18.0, respectively; Maryland, 12.0 and 18.9; and South Carolina, 9.8 and 16.6.

URBAN AREAS OF 10,000 POPULATION OR MORE

In the 941 places of 10,000 population or over, comprising 48.6 per cent of the total population of the birth registration area, there were 1,080,674 births, a rate of 19.1, and 694,703 deaths, a rate of 12.3. For the area outside of these cities there was a lower birth rate (18.7), as well as a lower death rate (10.5).

In cities having large colored populations, birth rates are generally higher for the white than for the colored, whereas the death rates in the majority of cities are higher for the colored.

INFANT MORTALITY

The infant mortality rate for 1930 (deaths of infants under one year of age per 1,000 live births) was 64.6. The number of deaths was 142,413. The infant mortality rate in 1929 was 67.6.

New Mexico (145.4) and Arizona (116.6) had the highest infant death rates; Washington (48.7), Nebraska (49.4), and Oregon (50.0) had the lowest.

In comparing the figures for the white and colored populations, the differences in infant mortality rates are marked. The white had a rate of 59.6, while the colored was 102.4. In all the States having large colored populations the rates for the colored are higher than those for the white, in some cases practically twice as high. For example, Kentucky had a rate for the white of 62.0, for the colored, 122.2; Maryland, white, 63.0, colored, 121.1; Oklahoma, white, 56.9, colored, 107.3; and Tennessee, white, 68.6, colored, 114.9.

With a few exceptions, the trend of the infant mortality rate for cities follows the rate for the States, and in many cases the contrasts are even more vivid.

¹ Deaths of nonresidents are included. Stillbirths are excluded.

² These rates represent annual rates per 1,000 population, as estimated for 1932 and 1931 by the arithmetic method.

³ Deaths under 1 year of age per 1,000 estimated live births. Cities left blank are not in the registration area for births.

⁴ Data for 81 cities.

⁵ Deaths for week ended Friday.

⁶ For the cities for which deaths are shown by color the percentages of colored population in 1930 were as follows: Atlanta, 33; Baltimore, 18; Birmingham, 38; Dallas, 17; Fort Worth, 16; Houston, 27; Indianapolis, 12; Kansas City, Kans., 19; Knoxville, 16; Louisville, 15; Memphis, 38; Miami, 23; Nashville, 28; New Orleans, 29; Richmond, 29; Tampa, 21; and Washington, D. C., 27.

⁷ Population Apr. 1, 1930; decreased 1920 to 1930, no estimate made.

PREVALENCE OF DISEASE

No health department, State or local, can effectively prevent or control disease without knowledge of when, where, and under what conditions cases are occurring

GENERAL CURRENT SUMMARY AND WEEKLY REPORTS FROM CITIES

The 92 cities reporting cases used in the following table are situated in all parts of the country and have an estimated aggregate population of more than 32,445,000. The estimated population of the 86 cities reporting deaths is more than 31,360,000. The estimated expectancy is based on the experience of the last nine years, excluding epidemics.

Weeks ended July 16, 1932, and July 18, 1931

	1932	1931	Estimated expectancy

Smallpox:			
86 cities	534	439	408

City reports for week ended July 16, 1932

The "estimated expectancy" given for diphtheria, poliomyelitis, scarlet fever, smallpox, and typhoid fever is the result of an attempt to ascertain from previous occurrence the number of cases of the disease under consideration that may be expected to occur during a certain week in the absence of epidemics. It is based on reports to the Public Health Service during the past nine years. It is in most instances the median number of cases reported in the corresponding weeks of the preceding years. When the reports include several epidemics, or when for other reasons the median is unsatisfactory, the epidemic periods are excluded, and the estimated expectancy is the mean number of cases reported for the week during non-epidemic years.

If the reports have not been received for the full nine years, data are used for as many years as possible but no year earlier than 1923 is included. In obtaining the estimated expectancy, the figures are smoothed when necessary to avoid abrupt deviation from the usual trend. For some of the diseases given in the table the available data were not sufficient to make it practicable to compute the estimated expectancy.

¹ Typhus fever, 4 cases and 1 death; 1 case at New York City, N. Y.; 1 case at St. Louis, Mo.; 1 death at Baltimore, Md.; 1 case at Charleston, S. C.; and 1 case at Fort Worth, Tex.

The following table gives the rates per 100,000 population for 98 cities for the 5-week period ended July 16, 1932, compared with those for a like period ended July 18, 1931. The population figures used in computing the rates are estimated mid-year populations for 1931 and 1932, respectively, derived from the 1930 census. The 98 cities reporting cases have an estimated aggregate population of more than 34,000,000. The 91 cities reporting deaths have more than 32,400,000 estimated population.

Summary of weekly reports from cities, June 12 to July 16, 1932—Annual rates per 100,000 population, compared with rates for the corresponding period of 1931¹

¹ The figures given in this table are rates per 100,000 population, annual basis, and not the number of cases reported. Populations used are estimated as of July 1, 1932 and 1931, respectively.

Hartford, Conn., Wichita, Kans., Covington, Ky., Little Rock, Ark., and Los Angeles, Calif., not included.

² Fort Wayne, Ind., and Columbia, S. C., not included.

³ Columbia, S. C., and Billings, Mont., not included.

⁴ Barre, Vt., Covington, Ky., and San Francisco, Calif., not included.

⁵ St. Paul, Minn., Raleigh, and Winston-Salem, N. C., Covington, Ky., New Orleans, La., and San Francisco, Calif., not included.

⁶ Barre, Vt., not included.

⁷ Hartford, Conn., not included.

⁸ Fort Wayne, Ind., not included.

⁹ Wichita, Kans., not included.

¹⁰ St. Paul, Minn., not included.

¹¹ Columbia, S. C., not included.

¹² Raleigh and Winston-Salem, N. C., not included.

¹³ Covington, Ky., not included.

¹⁴ Little Rock, Ark., not included.

¹⁵ New Orleans, La., not included.

¹⁶ Billings, Mont., not included.

¹⁷ Los Angeles, Calif., not included.

¹⁸ San Francisco, Calif., not included.

FOREIGN AND INSULAR

CANADA

Provinces—Communicable diseases—Two weeks ended July 9, 1932.—The Department of Pensions and National Health of Canada reports cases of certain communicable diseases for the two weeks ended July 9, 1932, as shown in the following table. Provinces not given in the table did not report, during the week, any case of any disease included in the table.

Province	Cerebro-spinal fever	Influenza	Lethargic encephalitis	Poliomyelitis	Smallpox	Typhoid fever
Nova Scotia.....		3				
New Brunswick.....						1
Quebec.....	1		1	5		79
Ontario.....				5	1	18
Saskatchewan.....					3	1
Alberta.....				2		3
British Columbia.....	2					1
Total.....		3	1	12	4	104

Quebec Province—Communicable diseases—Week ended July 9, 1932.—The Bureau of Health of the Province of Quebec, Canada, reports cases of certain communicable diseases for the week ended July 9, 1932, as follows:

Disease	Cases	Disease	Cases
Chicken pox.....	24	Poliomyelitis.....	3
Diphtheria.....	16	Puerperal fever.....	1
Erysipelas.....	3	Scarlet fever.....	35
German measles.....	1	Tuberculosis.....	65
Measles.....	36	Typhoid fever.....	29
Ophthalmia neonatorum.....	1	Whooping cough.....	50

CZECHOSLOVAKIA

Communicable diseases—May, 1932.—During the month of May, 1932, certain communicable diseases were reported in Czechoslovakia as follows:

Disease	Cases	Deaths	Disease	Cases	Deaths
Anthrax.....	8		Puerperal fever.....	32	19
Cerebrospinal meningitis.....	15	6	Scarlet fever.....	1,472	34
Diphtheria.....	1,546	69	Trachoma.....	165	
Dysentery.....	10	3	Typhoid fever.....	359	35
Malaria.....	78		Typhus fever.....	5	
Paratyphoid fever.....	18	1			

MALTA

Valetta—Communicable diseases—May, 1932.—During the month of May, 1932, cases of certain communicable diseases were reported in the port of Valetta, and in localities outside the port, as follows:

Disease	In port	Outside port	Disease	In port	Outside port
Broncho-pneumonia	4	2	Measles	8	
Cerebrospinal meningitis		2	Pneumonia	2	10
Chicken pox	11	6	Puerperal fever		2
Diphtheria	2		Scarlet fever	2	
Enteric fever	9	17	Trachoma	6	24
Erysipelas		1	Tuberculosis	4	13
Influenza		1	Undulant fever	59	73
Lethargic encephalitis	1		Whooping cough	14	26

YUGOSLAVIA

Communicable diseases—June, 1932.—During the month of June, 1932, certain communicable diseases were reported in Yugoslavia as follows:

Disease	Cases	Deaths	Disease	Cases	Deaths
Anthrax	57	6	Paratyphoid fever	12	
Cerebrospinal meningitis	16	11	Scarlet fever	222	12
Diphtheria and croup	357	37	Sepsis	7	2
Dysentery	31	1	Tetanus	67	38
Erysipelas	129	5	Typhoid fever	114	14
Measles	652	1	Typhus fever	16	1

CHOLERA, PLAGUE, SMALLPOX, TYPHUS FEVER, AND YELLOW FEVER

From medical officers of the Public Health Service, American consuls, International Office of Public Hygiene, Pan American Sanitary Bureau, health section of the League of Nations, and other sources. The reports contained in the following tables must not be considered as complete or final as regards either the list of countries included or the figures for the particular countries for which reports are given.

CHOLERA
