Chronic Obstructive Pulmonary Disease

COPD among Adults in NEBRASKA

What Is Chronic Obstructive Pulmonary Disease (COPD)?

COPD is the name for a group of diseases that restrict air flow and cause trouble breathing. COPD includes emphysema and chronic bronchitis. Chronic lower respiratory disease, including COPD, is the third leading cause of death in the United States.¹ Fifteen million Americans have been diagnosed with COPD.² Two decades ago, more than 50% of adults with poor pulmonary function were not aware that they had COPD, therefore millions more may have it.³

Symptoms

- Chronic cough (also known as smoker's cough).
- Chronic phlegm production.
- Shortness of breath while doing things you used to be able to do.
- Not being able to take a deep breath.
- · Wheezing.

Causes

Tobacco use is the primary cause of COPD in the United States, but air pollutants at home (such as secondhand smoke and some heating fuels) and at work (such as dusts, gases, and fumes), and genetic predisposition also can cause COPD.

Prevention and Treatment

For current smokers, smoking cessation is essential for preventing COPD. Eliminating exposure to tobacco smoke and other environmental pollutants is also important. While there is no cure for COPD, treatment is available to manage the symptoms that are caused by COPD and improve quality of life. Treatment options include medication (such as inhalers), pulmonary rehabilitation, physical activity training, and oxygen treatment.

COPD Risk Factors

You may be at an increased risk if you are older than 40 years and

- Have symptoms of COPD.
- · Have a history of smoking.
- Have been exposed to environmental or occupational pollutants.

Please talk with your health care provider about being tested for COPD using spirometry (a breathing test).

4.9% (age-adjusted = 4.6%) of Nebraska residents surveyed in 2011 reported having been told by a health care professional that they have COPD. The map below depicts quartiles of the national prevalence of COPD by state for comparison.

Age-Adjusted[†] Percentage of U.S. Adults with COPD by State or Territory, 2011*

†Age-adjusted to the 2000 U.S. standard population.

COPD among Adults in Nebraska Page 2 of 3

The table to the right breaks down the prevalence of COPD among Nebraska adults by age, race/ethnicity, sex, employment status, education level, income, marital status, smoking status, and asthma history.

Respondents were more likely to report COPD (p<0.05) if they

- · Were female.
- Were unable to work.
- Had a household income of \$25,000 or less.
- Were divorced, widowed, or separated.
- Had a history of smoking (current or former).
- Had a history of asthma.

Respondents were <u>less likely</u> to report COPD (p<0.05) if they

- Were aged 44 years or younger.
- · Were male.
- Had at least some college education.
- Had a household income of \$75,000 or more.
- · Had never smoked.
- · Had no history of asthma.

The figure below compares health and health care characteristics by COPD status.

Compared with adults without COPD, adults with COPD were more likely (p<0.05) to report

- They had a primary health care provider.
- · Cost was an obstacle to health care.
- · Poor/fair health status.
- A health condition limited activity.
- Fourteen or more poor mental health days in the past 30 days.
- No exercise in the past month.

^{*}BRFSS for 2011. Respondents were asked, "Have you ever been told by a doctor or health professional that you have COPD, emphysema, or chronic bronchitis?"

^{**}Relative standard error ≥0.3. Learn more about BRFSS methodology at www.cdc.gov/BRFSS.

COPD among Adults in Nebraska Page 3 of 3

In 2011, 21 states, the District of Columbia, and Puerto Rico administered an optional module as part of the annual BRFSS survey. The questions in the optional module asked about COPD-related health care behaviors and health-related quality of life and were asked of respondents who reported having COPD.

The results for all these states may be found in "Chronic Obstructive Pulmonary Disease Among Adults—United States, 2011." *MMWR*. 2012;61:938-943. http://www.cdc.gov/mmwr/PDF/wk/mm6146.pdf.

Among 1,008 Nebraska Adults with COPD **Diagnosis Spirometry** is the current standard of COPD 61.8% diagnosis. Spirometry is a simple breathing test administered by a health care professional that reported being diagnosed measures how much air you breathe out and how using spirometry fast you can blow air out. Spirometry can also determine how severe COPD is and help guide doctors to decide on the appropriate treatment. Management 45.8% Although there is no cure for COPD, treatment exists that can prevent worsening of the reported using at least one disease. Daily COPD **medications** can be used daily COPD medication to manage symptoms. 46.1% reported seeing a doctor about COPD **Doctor Visits and Hospitalization** symptoms in the previous 12 months COPD poses a significant economic burden. In 2008, the cost to the nation for COPD and asthma 16.6% was estimated to be approximately \$68.0 billion in healthcare expenditures and lost productivity.1 reported a hospital or emergency department visit for COPD symptoms in the previous 12 months **Quality of Life** 49.9% COPD causes shortness of breath, which makes it difficult to do the things you used to be able to do, reported that shortness of breath at work and at home. These symptoms can cause affected their quality of life

decreased quality of life and loss of productivity.
