

Morbidity and Mortality

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE / PUBLIC HEALTH SERVICE HEALTH SERVICES AND MENTAL HEALTH ADMINISTRATION
DATE OF RELEASE: DECEMBER 19, 1969 - ATLANTA, GEORGIA 30333

EPIDEMIOLOGIC NOTES AND REPORTS
SERUM HEPATITIS - Savannah, Georgia

In Savannah, Georgia, since late November 1969, two teenagers have died with fulminating hepatitis, probably related to parenteral inoculation of narcotics with unsterile needles. After these deaths, the incidence of narcotics-associated hepatitis in Savannah was investigated. A total of 56 cases with onset in 1969 were uncovered (Figure 1).

Of these 56 cases, 24 were found by review of hospital records, nine by reports from community physicians, and 23 by interviews with 70 narcotics users in Savannah. The 70 drug users attended a special clinic set up during the investigation and were part of a group of approximately 100 teenagers who frequently shared needles. Of the 70 persons, 31 had clinical histories compatible with hepatitis

or had abnormal liver function studies (23 nonhospitalized and the eight hospitalized). Serum from six of the 31 demonstrated Australia antigen, and serum from one had anti-Australia antibody (Table 1). The other 39 had no clinical or laboratory evidence of hepatitis or Australia antigen.

BY MONTH OF ONSET
SAVANNAH, GEORGIA - 1969

Table 1
Narcotics-Associated Hepatitis Cases
Savannah, Georgia - 1969

Method of Identification	Number Cases	Number Tested for Au Antigen*	Number Positive	Percent
Hospital Records	24**	8	2	25
Interview and Laboratory Data	23	23	4	17
Physician Records	9	0	0	0
Total	56	31	6	19

* Australia antigen, tested by agar gel diffusion technique.

** Eight hospitalized patients were also interviewed at special clinic.

Of the total 56 narcotics-associated cases uncovered, 47 (including the two fatal cases) were in Caucasians and nine were in Negroes. The 47 were close friends and were part of the previously mentioned 100 teenagers. The 32 boys and 15 girls ranged in age from 14 to 20 years (mean 17.5 years). Most had used drugs parenterally for approximately 3 months (range 2 to 12 months), and all had been familiar with marijuana for 1 to 3 years. The majority (28 of 32 questioned) identified with the middle socioeconomic class in their community, two with the upper class, and two with the lower.

(Reported by John E. McCroan, Ph.D., Director of Epidemiologic Investigations Branch, and an Assistant Epidemiologist, Georgia State Department of Public Health; Wilbur D. Lundquist, M.D., District Director of Public Health, Chatham County, Georgia; Enteric Virology Unit, Laboratory Division, NCDC; and two EIS Officers.)

CURRENT TRENDS INFLUENZA - United States

During the week ending December 13, 1969, all state health departments were contacted to survey the present level of influenza activity. Although many states reported seasonal increases in upper respiratory illnesses, there were few reports of outbreaks of influenza-like illness.

Laboratory-confirmed outbreaks of influenza have occurred in Alaska (see accompanying story) and in Puerto Rico, where there have been several small scattered outbreaks. Laboratory confirmation in Puerto Rico is based on fourfold rises in hemagglutination-inhibition antibody titer. In both Alaska and Puerto Rico, the etiologic agent is an A2/Hong Kong-like virus.

Small outbreaks of influenza-like illness, for which there has been no laboratory confirmation as yet, have occurred in three counties in West Virginia and in Des Moines, Iowa.

This fall and winter, there has been no sustained excess mortality due to pneumonia-influenza in the 122 U.S. cities reporting (Figure 2).

(Reported by Donald K. Freedman, M.D., Director, Division of Public Health, Alaska Department of Health and Welfare; S. L. Hendricks, D.V.M., Acting Director, Division of Preventive Medical Services, Iowa State Department of Health; Dr. Raphael Correa-Coronas, Auxiliary Secretary of Health for Preventive Medicine, Puerto Rico Department of Health; and N. Allen Dyer, M.D., State Director of Health, West Virginia State Department of Health; and the Statistical Services Activity and Viral Diseases Branch, Epidemiology Program, NCDC.)

EPIDEMIOLOGIC NOTES AND REPORTS

INFLUENZA - Alaska

During the last 3 weeks, influenza-like illness has spread from the Anchorage metropolitan area to involve extensively many communities in the South Central and Northern regions and has largely spared the Southeastern region. Large outbreaks were reported between November 23 and December 6 in Homer, Anchor Point, and Minilchik. Further outbreaks between December 6 and 15 were reported in the Nome and Kotzebue area and in Fairbanks. Influenza activity has just begun in Bethel. School absenteeism reached 15-20 percent in Anchorage and Homer, both of which were involved with A2/Hong Kong/68 influenza in 1968. In Anchor Point and Minilchik, which were not involved in 1968, school absenteeism reached 30-40 percent. Virus isolates have been confirmed by the WHO International Influenza Center for the Americas as being similar to A2/Hong Kong/68. Extensive epidemiologic studies are in progress in the involved areas and include further attempts at virus isolation, serologic surveys, and intensive observation of certain populations vaccinated with the currently recommended vaccine strains.

(Reported by Donald K. Freedman, M.D., Director, Division of Public Health, Alaska Department of Health and Welfare; Paul Eneboe, M.D., Homer; Arctic Health Research Center, Environmental Control Administration, CPEHS, USDHEW, College, Alaska; and the Medical Epidemiologist, Ecological Investigations Program, Alaska Activities and Arctic Health Research Center.)

INTERNATIONAL NOTES

SMALLPOX ERADICATION PROGRAM

West and Central Africa

In November 1969, the 100 millionth smallpox vaccination was administered in the West and Central African Smallpox Eradication Program. The program, sponsored by the U.S. Agency for International Development and the National Communicable Disease Center, began vaccinations in January 1967, with the objective of eradicating smallpox in a 20-country area in West and Central Africa with a population of 119 million persons. The program has resulted in a dramatic reduction in smallpox incidence rates in these countries which in 1967 were the highest in the world. Since the first week of October 1969, there have been no reported smallpox cases in the 20-country area.

(Reported by the Smallpox Eradication Program, NCDC.)

THE MORBIDITY AND MORTALITY WEEKLY REPORT, WITH A CIRCULATION OF 20,000 IS PUBLISHED AT THE NATIONAL COMMUNICABLE DISEASE CENTER, ATLANTA, GEORGIA.

DIRECTOR, NATIONAL COMMUNICABLE DISEASE CENTER
