

Supplementary Appendix

This appendix has been provided by the authors to give readers additional information about their work.

Supplement to: Makhema J, Wirth KE, Pretorius Holme M, et al. Universal testing, expanded treatment, and incidence of HIV infection in Botswana. *N Engl J Med* 2019;381:230-42. DOI: [10.1056/NEJMoa1812281](https://doi.org/10.1056/NEJMoa1812281)

Impact of a Universal HIV Testing and Expanded Treatment Strategy on Population HIV Incidence in a Community-Randomized Trial

Joseph Makhema, MD, FRCP, Kathleen E. Wirth, ScD, Molly Pretorius Holme, MS, Tendani Gaolathe, MD, Mompoti Mmalane, MD, FRCS, MSc, Etienne Kadima, MD, MPH, Unoda Chakalisa, MD, Kara Bennett, MS, Jean Leidner, MS, Kutlo Manyake, GN, Atang Matildah Mbikiwa, BA, Selebaleng V. 	Method of Randomization	3
Figure S1	Summary of HIV Acquisition and Completeness of HIV-1 RNA Assessment among N=8,974 Participants with a HIV-Negative Test Result at Enrollment to Ya Tsie According to Randomization Arm	4
Figure S2	Recruitment, Eligibility, and Enrollment of Participants for a One-Time, End-of-Study Survey in Six Communities (3 Matched Pairs) in Ya Tsie at the Household and Participant Level According to Randomization Arm	5
Table S1	Age and Sex Distribution of Communities Participating in Ya Tsie According to Botswana Census and Enumerated, Eligible Household Members, and Enrolled Participants	6
Table S2	Baseline Characteristics of N=147 Participants Who Seroconverted after a HIV-Negative Test Result at Enrollment to the HIV Incidence Cohort of Ya Tsie, According to Randomization Arm	7

Table S3	Multivariate-Adjusted Odds Ratios (ORs) and 95% Confidence Intervals (CIs) Obtained from a Logistic Regression Model for Enrollment among Enumerated, Eligible Household Members in Ya Tsie and Used to Adjust for Potential Selection Bias Due to Non-Participation	8
Table S4	Multivariate-Adjusted Odds Ratios (ORs) and 95% Confidence Intervals (CIs) Obtained from a Pooled Logistic Regression Model for Death during Follow-Up in Ya Tsie and Used to Adjust for Potential Selection Bias due to Dependent Censoring	11
Table S5	Summary of Incidence Ratios (IRs) and 95% Confidence Intervals (CIs) for HIV Incidence Adjusted for Potential Bias Due to Non-Participation and Dependent Censoring Due to Death and Obtained from a Weighted Cox Proportional Hazards Model with Robust Standard Errors	12
Table S6	Multivariable-Adjusted Hazard Ratios (HRs) and 95% Confidence Intervals (CIs) for Acquisition of HIV Infection during Study Follow-Up among N=8,974 Participants Testing HIV-Negative at Enrollment in Ya Tsie	13
Table S7	Initiation of Antiretroviral Treatment (ART) during Study Follow-Up and Timing of Initiation among N=979 HIV-Positive Participants Not on ART at Enrollment to the 20% Cohort of Ya Tsie, Overall and According to Randomization Arm	14

Method of Randomization

The name of each community in the first pair of matched communities was written on a piece of paper and placed inside an opaque plastic ball; the name of one community was put into one ball, and the name of the other community was put into another ball of the same color (e.g. red). The two plastic balls were then placed in a bowl or sack and shuffled.

The names of the study arms, "Control" and "Intervention," were each written on a piece of paper and put into an opaque plastic ball of another color (e.g. blue) and placed in a second bowl or sack and shuffled.

A designated person picked a ball from bowl/sack 1 and announced the name of the community, and a staff member held up a sign with the name. Another designated person picked a ball from sack 2 and announced the study-arm assignment, and another staff member held up a sign with the assignment and stood next to the first name sign. Another designated person revealed the remaining balls and the remaining signs were held up together.

This completed the assignment for the first pair. The same procedure was followed for each subsequent pair. This procedure was conducted in the presence of witnesses who were not part of the study team.

Figure S1. Summary of HIV Acquisition and Completeness of HIV-1 RNA Assessment among N=8,974 Participants with a HIV-Negative Test Result at Enrollment to Ya Tsie According to Randomization Arm.

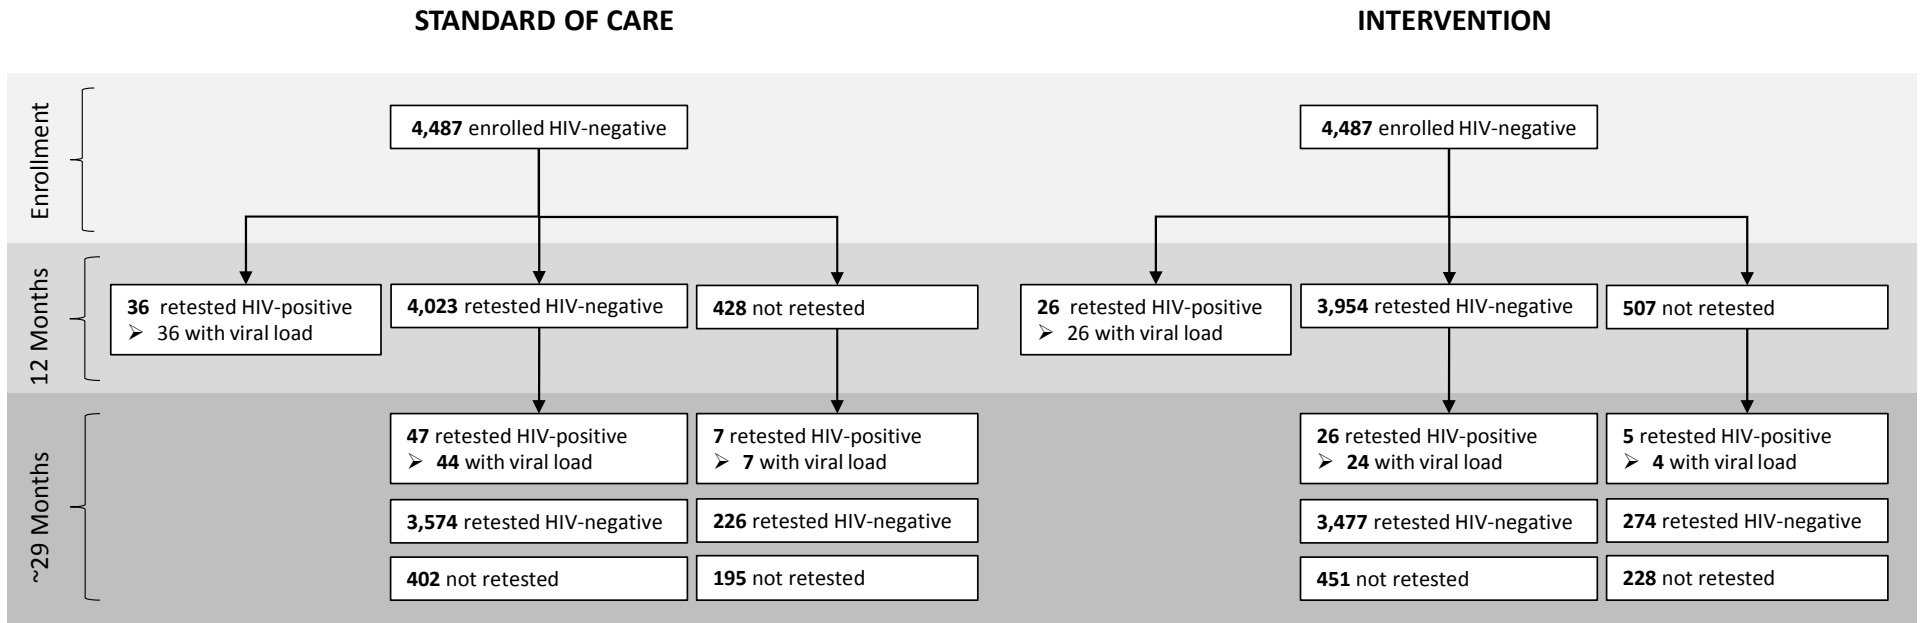

Figure S2. Recruitment, Eligibility, and Enrollment of Participants for a One-Time, End-of-Study Survey in Six Communities (3 Matched Pairs) in the Ya Tsie Study at the Household and Participant Levels According to Randomization Arm.

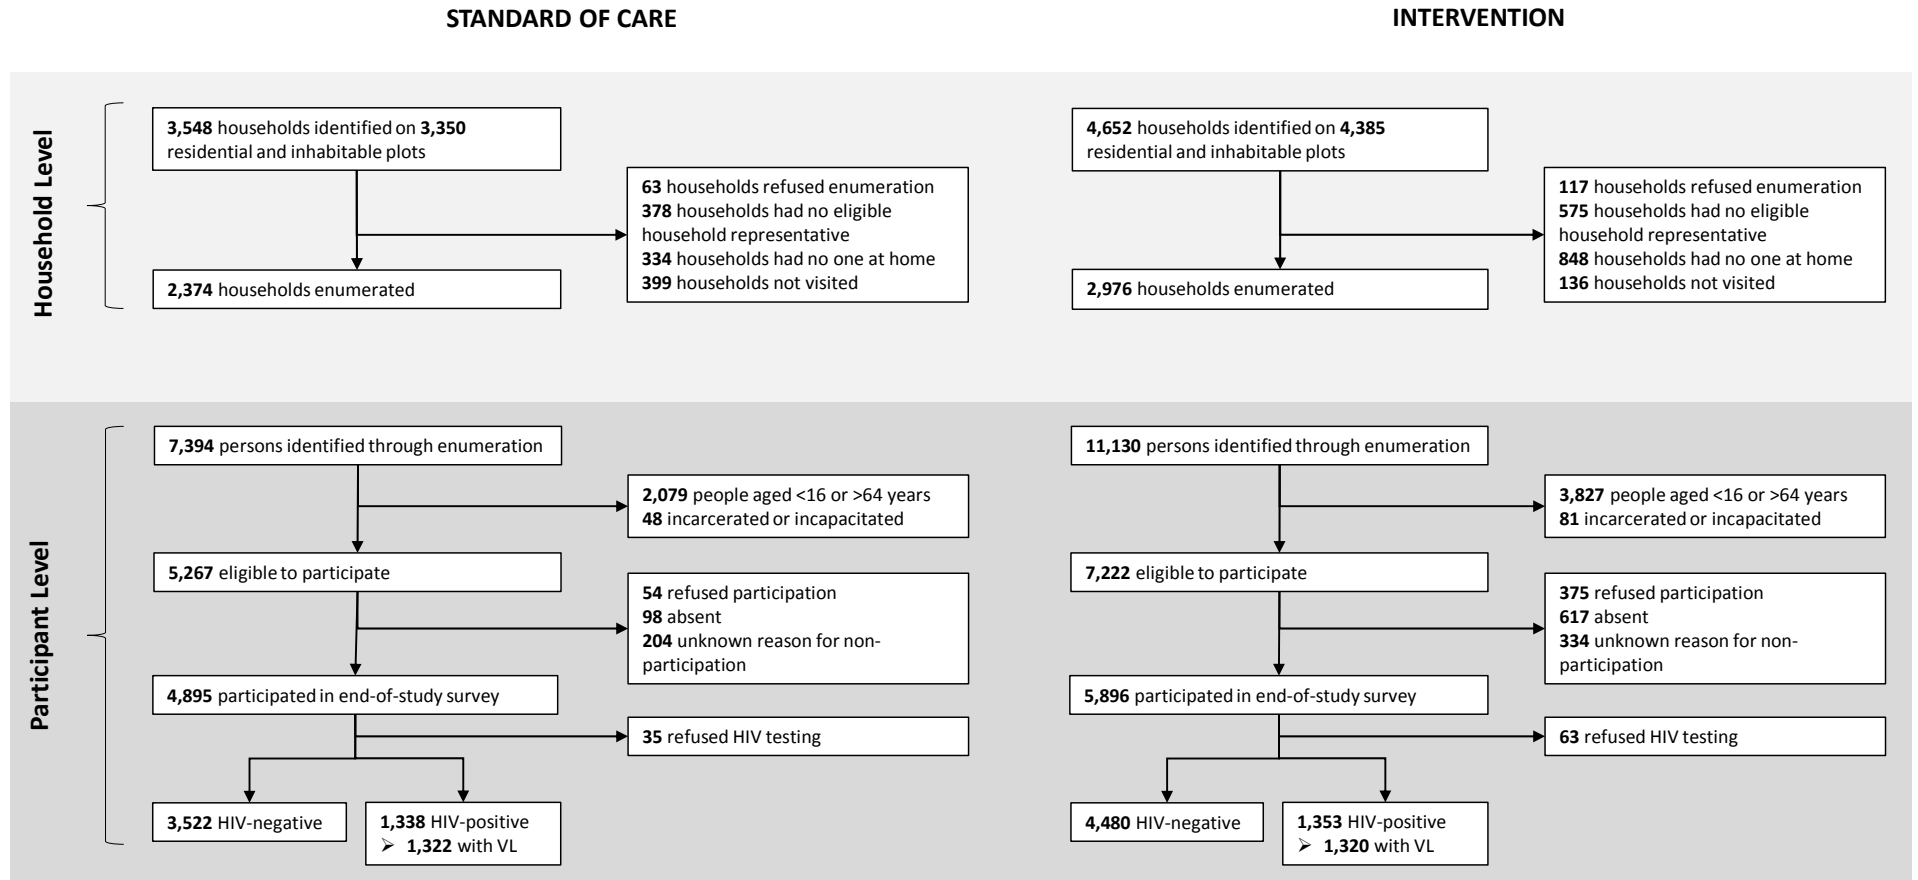

Table S1. Age and Sex Distribution of Communities Participating in Ya Tsie According to Botswana Census and Enumerated, Eligible Household Members, and Enrolled Participants.

	Population, N (%)		
	2011 Botswana Census	Enumerated, eligible Ya Tsie household members	Enrolled Ya Tsie participants
Females			
16–24 years	15,731 (17%)	2,321 (15%)	1,979 (16%)
25–34 years	14,911 (16%)	2,586 (17%)	2,242 (18%)
35–44 years	9,450 (10%)	1,868 (12%)	1,592 (13%)
45–54 years	7,290 (8%)	1,445 (9%)	1,232 (10%)
55–64 years	4,905 (5%)	1,120 (7%)	1,005 (8%)
Males			
16–24 years	14,055 (15%)	1,874 (12%)	1,434 (11%)
25–34 years	11,714 (12%)	1,742 (11%)	1,270 (10%)
35–44 years	7,760 (8%)	1,213 (8%)	838 (7%)
45–54 years	4,943 (5%)	809 (5%)	573 (5%)
55–64 years	3,248 (3%)	596 (4%)	445 (4%)

Table S2. Baseline Characteristics of N=147 Participants Who Seroconverted after a HIV-Negative Test Result at Enrollment to the HIV Incidence Cohort of Ya Tsie, According to Randomization Arm.

Characteristic (<i>n</i> with data)	Randomization arm, N (%)	
	Standard of care (N=90)	Intervention (N=57)
Age at enrollment (<i>n</i> =147)		
16–24 years	40 (44%)	25 (44%)
25–34 years	37 (41%)	17 (30%)
35–44 years	5 (6%)	10 (18%)
45–54 years	1 (1%)	3 (5%)
55–64 years	7 (8%)	2 (4%)
Female gender (<i>n</i> =147)	70 (78%)	49 (86%)
Relationship (<i>n</i> =146)		
Single/never married	82 (92%)	54 (95%)
Married	4 (4%)	3 (5%)
Widowed, divorced, or separated	3 (3%)	0 (0%)
Education (<i>n</i> =147)		
Primary or less	16 (18%)	9 (16%)
Junior secondary	41 (46%)	30 (53%)
Senior secondary	23 (26%)	15 (26%)
Higher than senior secondary	10 (11%)	3 (5%)
Income (<i>n</i> =147)		
None	50 (56%)	35 (61%)
<\$96 per month	17 (19%)	12 (21%)
\$96 to \$477 per month	21 (23%)	9 (16%)
>\$477 per month	2 (2%)	1 (2%)
Alcohol consumption, past 1 month (<i>n</i> =146)		
Never	61 (69%)	43 (75%)
Less than once per week	10 (11%)	4 (7%)
Once per week	4 (4%)	5 (9%)
2–3 times per week	7 (8%)	4 (7%)
More than 3 times per week	7 (8%)	1 (2%)
Number of sexual partners, past 12 months ^a (<i>n</i> =129)		
None	8 (10%)	7 (14%)
1 partner	38 (49%)	33 (65%)
2 partners	26 (33%)	9 (18%)
3 partners	4 (5%)	1 (2%)
4 or more partners	2 (3%)	1 (2%)
Concurrent sexual partnerships, past 12 months ^b (<i>n</i> =114)	32 (46%)	11 (25%)
Alcohol use by participant and/or partner during last sex ^a (<i>n</i> =134)	15 (19%)	7 (13%)
Self-reported circumcised ^c (<i>n</i> =28)	5 (25%)	2 (25%)

^a Proportions calculated among *n*=135 participants reporting any lifetime sexual activity.

^b Proportions calculated among *n*=114 participants reporting one or more sexual partners during the past 12 months.

^c Proportions calculated among *n*=28 HIV-negative men aged 16–49 years.
